[-] WE305 - Seeing Beyond the Glare of "EcoBling": A Tale of Two Climates — FREE

Date:	Wednesday, May 16
Time:	1:00 pm - 5:00 pm
Description:	We have designed, built, and sold "net-zero-energy" homes between 2004 and 2010. Why have some succeeded and others not? Green "by design" pays. However, a reliance on "EcoBling" and the latest green gizmos does not. Too often we get wrapped up in questionable strategies while trivializing the importance of sound design. Or we suffer from the checklist approach to green building, involved [illegible] suppliers and green-rating consultants [illegible] regarding conservation of resources. The complex [illegible] decisions and component selections interact to affect [illegible] resources in a way that appeals to the [illegible] in a enlightening format. Advanced green building science strategies will be presented and critiqued—what worked and what has not worked out so well. Truly sustainable designs follow a common thread—that a successful project is more than a sum of its parts, and a collaboration between the client, the design professionals, and the various contractors can yield more for less money spent. And nothing is less sustainable then a building that either isn't beautiful or can't afford to be built. We address the common perception that "green" must always be synonymous with "expensive." Peter Pfeiffer, FAIA, and Phil Kaplan, AIA, aim to offer a compelling look into their approaches to building net-zero-energy homes in dramatically different climates—Texas and Maine—each with its own set of challenges and limitations.
