Broadening the Perspective of Technology in Architectural Practice

Martin Fischer

Professor, Civil and Environmental Engineering
and (by courtesy) Computer Science

Director, Center for Integrated Facility Engineering (CIFE)
Stanford University

<http://www.stanford.edu/~fischer>
fischer@stanford.edu

Additional Roles:

- Senior Fellow, Precourt Institute for Energy
- Lead, Building Energy Efficiency Research, Precourt Energy Efficiency Center (PEEC)
- Affiliated Faculty, Woods Institute for the Environment
- Affiliated Faculty, Emmett Interdisciplinary Program in Environment and Resources (E-IPER)
- Foreign Member, Royal Swedish Academy of Engineering Sciences

Project - Canview 7117(template.html)

VDC practice is becoming mainstream: What is creating the next chasm?

CIFE Development and Background

- 100% funded by industry
 - Building owners
 - Design and construction companies
 - Software and hardware vendors
- 1988-2000
 - Building Information Modeling (BIM)
- 2000-2010
 - Virtual Design and Construction (VDC)
- 2010+
 - Integrated Facility Engineering
 - Breakthrough performance

The CIFE community (industry, academia)
invents the next practice together

How much do you
want to earn per
hour?

More than 11.9 cents?

1 hour of computing in the
cloud costs 12 cents.

What can you do with
3.5 Million data
points per day for a
building?
(Y2E2 Building
Stanford)

Or 500 Million data
points per day for a
campus?
(Microsoft Puget
Sound)

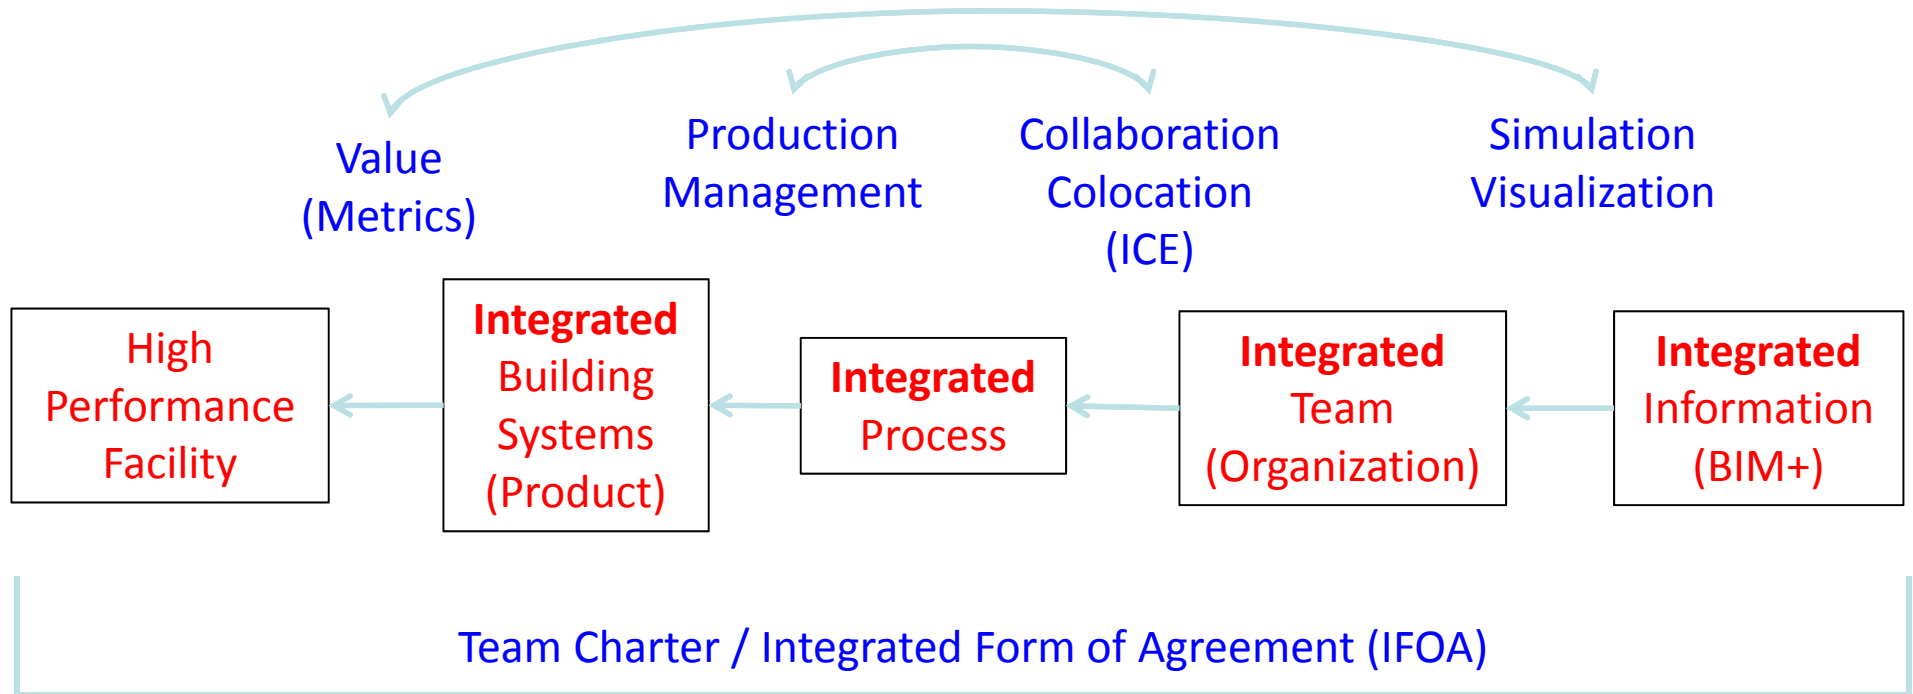

Global trends that will affect the AEC industry dramatically

- Computing is (almost) free
 - Computing is mobile
 - Data are abundant
 - “What you see is what you get” is today’s good practice
 - Projects must be economically, environmentally, and socially sustainable
 - The world is flat
- All this is normal for today’s high school students

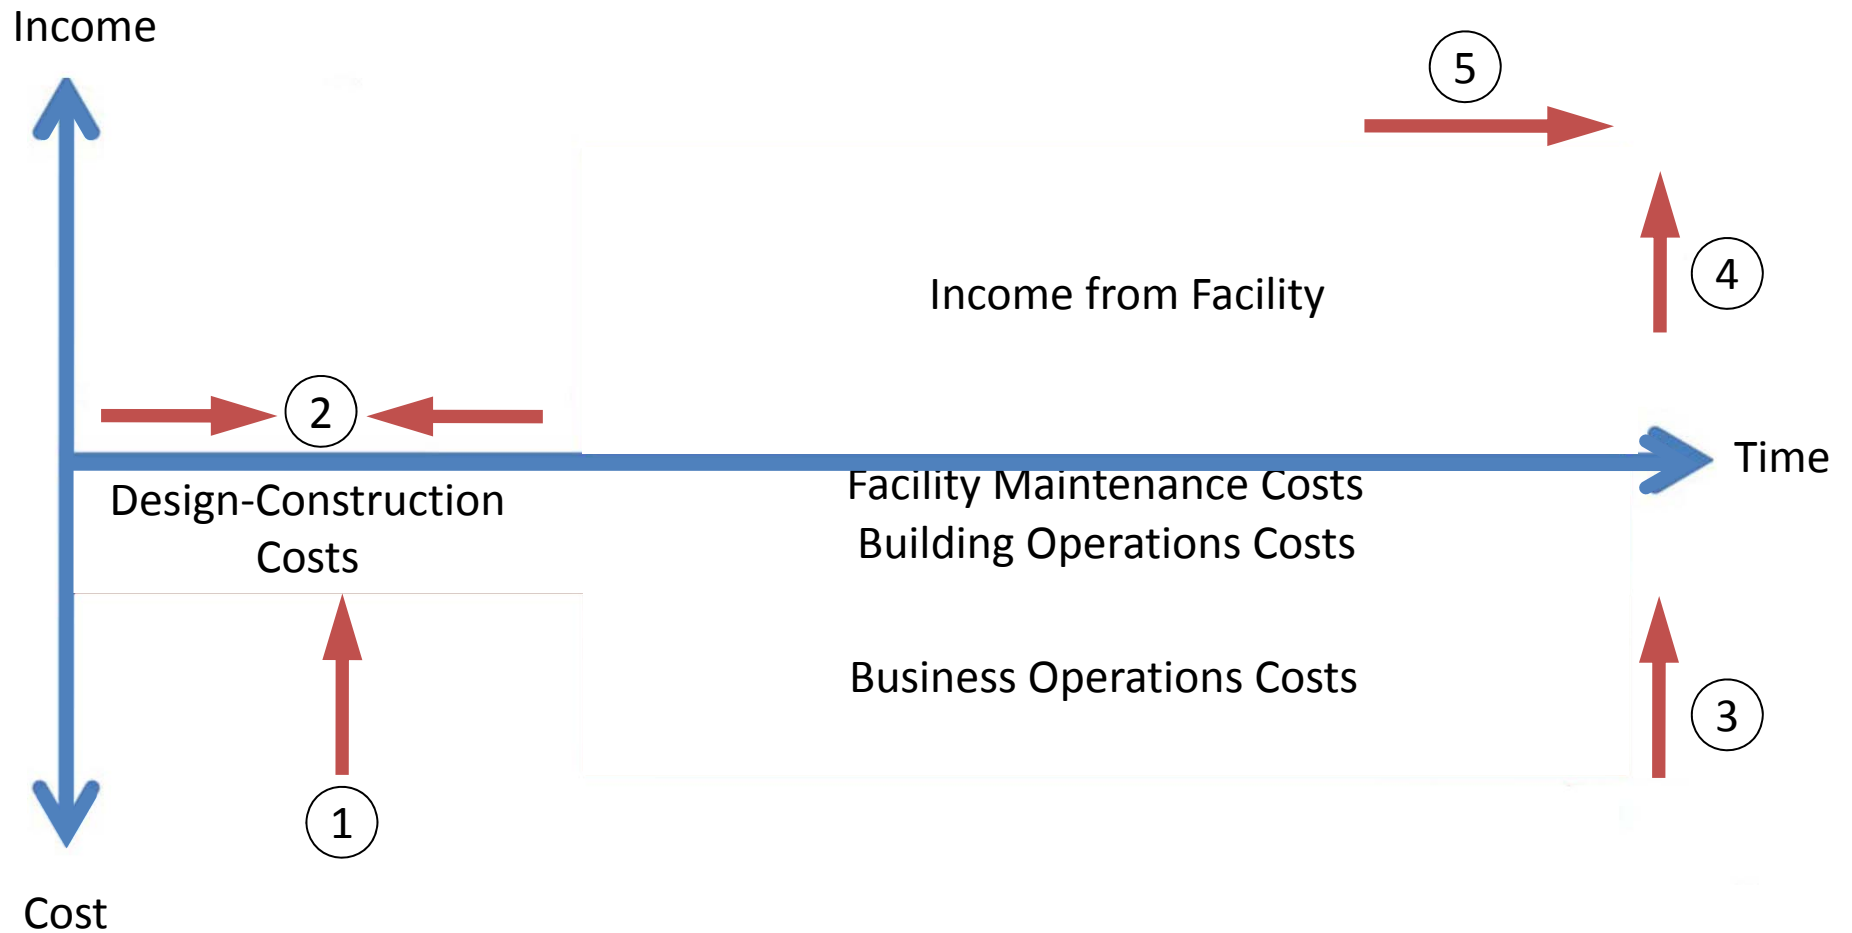

Project teams must deliver a high-performing building with high reliability. Such a building ...

- is buildable
 - can be operated efficiently
 - makes the users of the facility productive
 - enhances its environmental and social context
-
- and contributes to learning how to do it even better next time.

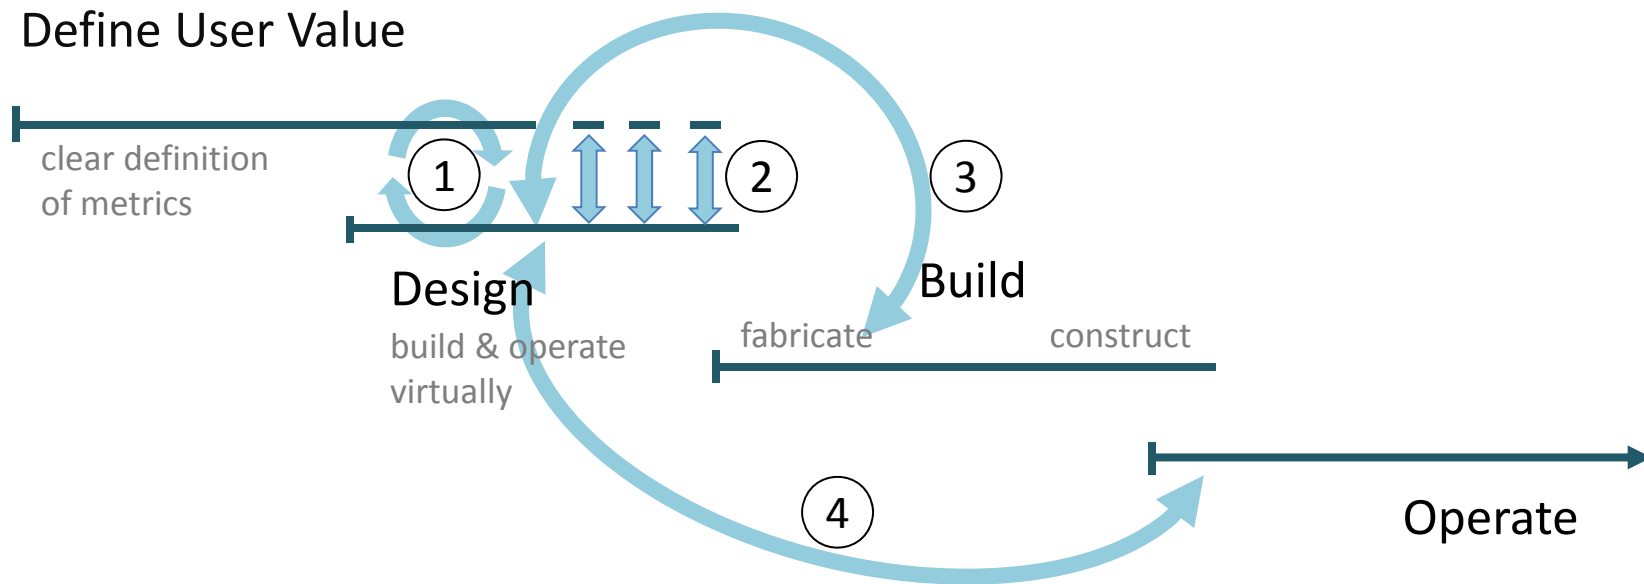

To achieve high-performance facilities, we need a **strategy** and **methods** for integration

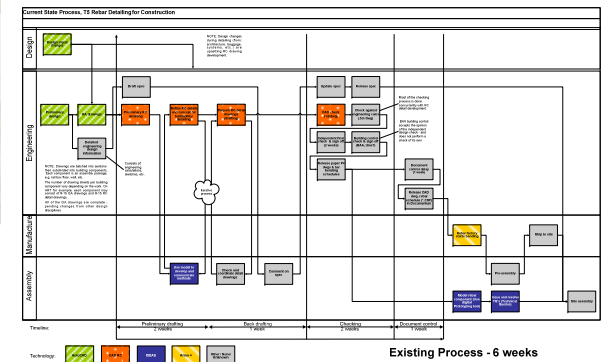

- A facility functions as a whole.
- We must break up a project into clear controllable work assignments.
- How to make sure that the performance of the whole facility does not suffer because of everyone's optimization efforts at the task level?

Process Integration

Virtual Design and Construction (VDC)

Data

Interface with Engineering and Project Control and Management Systems

Visualization - Integration - Automation

3 Levels of BIM

1. Visualization (manual integration)

- Model and visualize all “expensive” elements of the product, organization, and process
- Get input from team members and stakeholders when it matters
- Incrementally enhance project objectives
- Pay for with project funds

2. Integration (computer based)

- Building information models “interoperate” between disciplines and connect to other data sets (cost estimates, schedules, etc.)
- Single data entry
- Requires corporate, multi-project support

3. Automation

- Automated design and (CNC) manufacturing
- Do high-quality work really fast all the time
- Enables breakthrough project performance
- Requires corporate, multi-project support

Past → Present → Future

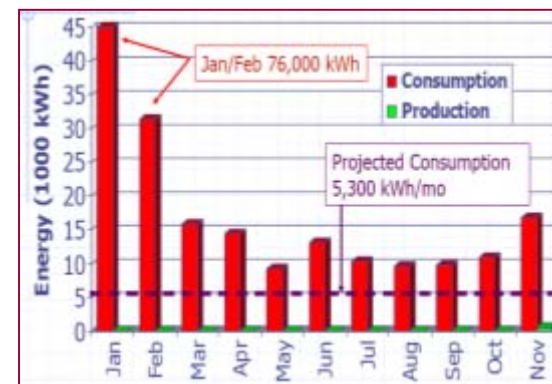

- Yesterday's practice:
YCASWYG
You can't always see what you get

- Today's practice:
WYSIWYG
What you see is what you get

- Next practice:
WYMIWYG
What you model is what you get
performance

2011

The Business Perspective

“Automated execution of processes changes everything.”

(Alan Perlis, 1961)

The Scientific Perspective

“Science is knowledge which we understand so well that we can teach it to a computer; and if we don't fully understand something, it is an art to deal with it. Since the notion of an algorithm or a computer program provides us with an extremely useful test for the depth of our knowledge about any given subject, the process of going from an art to a science means that we learn how to automate something.”

(Donald Knuth, Computer Programming as an Art, CACM, Dec. 1974)

REDUCING THE COST OF STEEL STRUCTURES USING COMPUTATIONAL DESIGN OPTIMIZATION

DESIGN PROBLEM

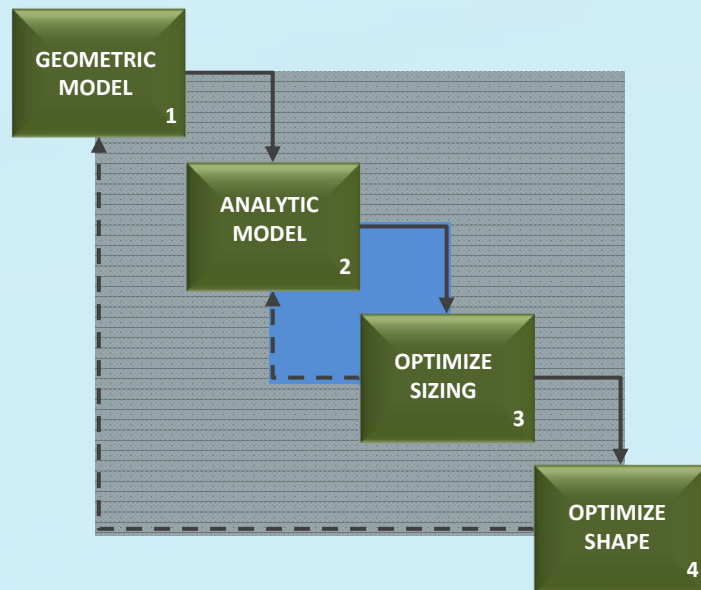

Objective: Minimize steel weight

Constraints: Safety and serviceability

Variables: 1955 size and shape variables

Possible design alternatives: $\sim 10^{2435}$

BiOPT METHOD

 FCD Sizing Algorithm
(Flager, et al. 2011)

 SELOPT Algorithm
(Booker, et al. 1999)

CASE STUDY RESULTS

	convention al design method	FCD (128 cpu) design method
--	--------------------------------------	--------------------------------------

PROCESS

Design cycle time	4 hrs	3 sec
Alternatives evaluated	39	12,800
Total design time	216 hrs	151 hrs

PRODUCT

Total steel weight	2,728 met t	2,292 met t
Est. cost saving (USD)	-	\$4 M (-19%)

- Orders of magnitude reduction in design cycle time
- Evaluation of a greater number of design alternatives
- Improved product quality

Case Study: Overseas Housing Development With Lepech/Flager/Basbagill

SCOPE

- (1) Housing buildings
 - substructure ● shell ● interiors ● services

OBJECTIVES

- (1) Minimize life-cycle cost
- (2) Minimize carbon footprint

VARIABLES

- (1) Number of buildings: 3 - 4
- (2) Number of stories: 5 - 8
- (3) Building footprint: H-shape
- (4) Building orientation: 0-360°

CONSTRAINTS

- (1) Gross Floor Area (GFA):
1,500m²
- (2) Distance to site perimeter:
>20m
- (3) Distance between building:
>20m

DESIGN SPACE SIZE

Possible design configurations:
1.46E11

3 Base Design

Parallel Coordinates Plot: 3 Designs

Life-Cycle Cost vs. Carbon Footprint: 3 Designs

MDO Design Method

Parallel Coordinates Plot: 3 Designs

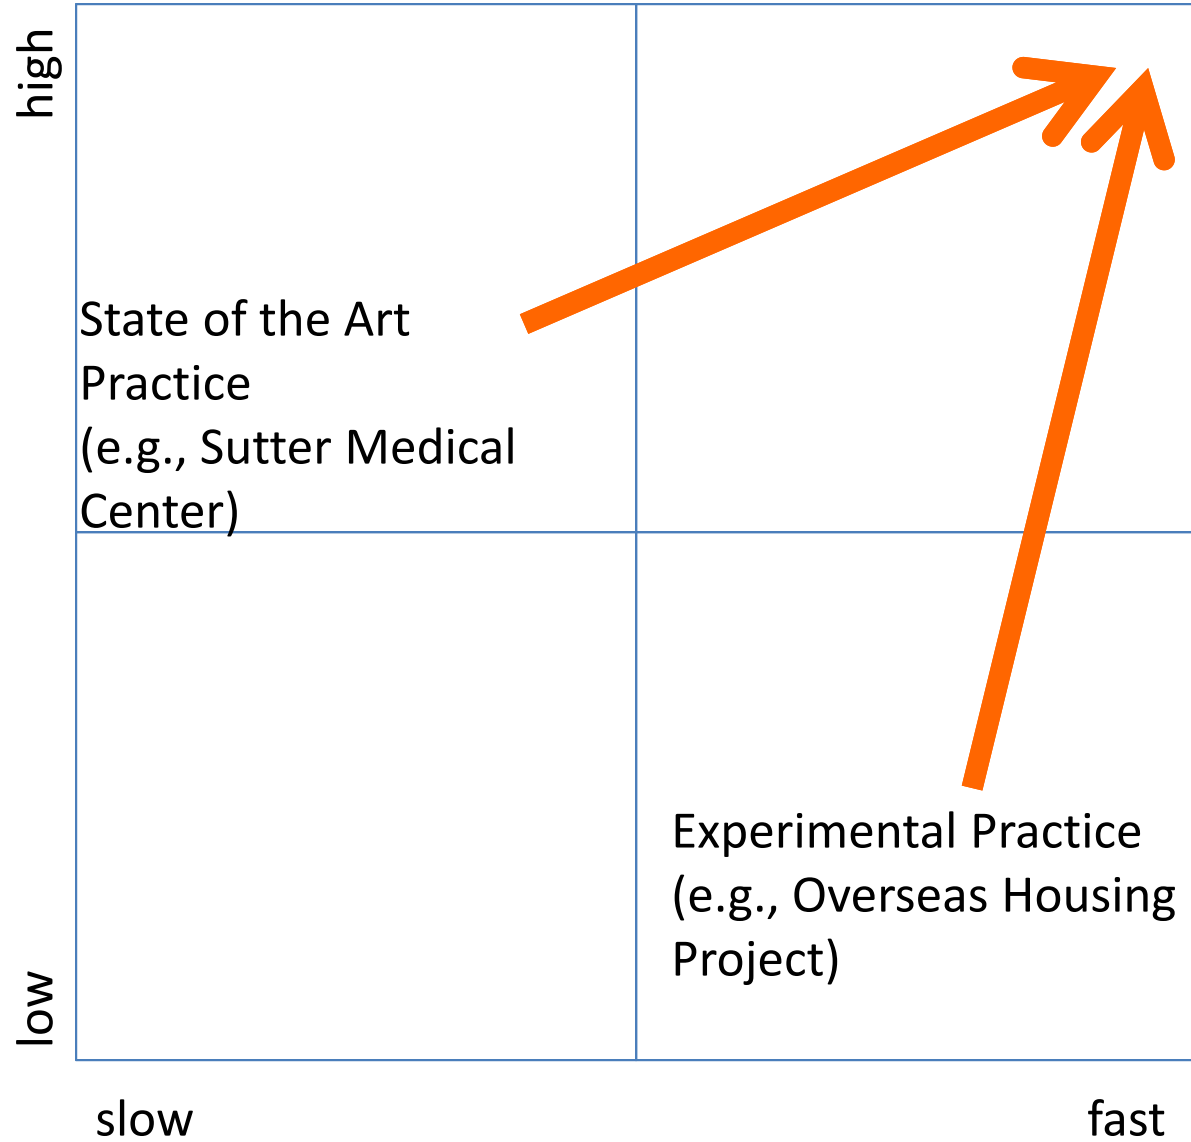

Results: Life-Cycle Cost vs. Carbon Footprint

Comparing Performance of Conventional Design Process with MDO (Multi-disciplinary Optimization)

	Conventional	MDO
Set-up time	60 hrs	140 hrs
Design cycle time	34 hrs	11 sec
Alternatives evaluated	3	21,360
Total design time	162 hrs	210 hrs
Life-cycle cost savings (USD)	-	\$27 M
Carbon footprint reduction (CO ₂ e)	-	10 kt

Completeness of Product/Process Models

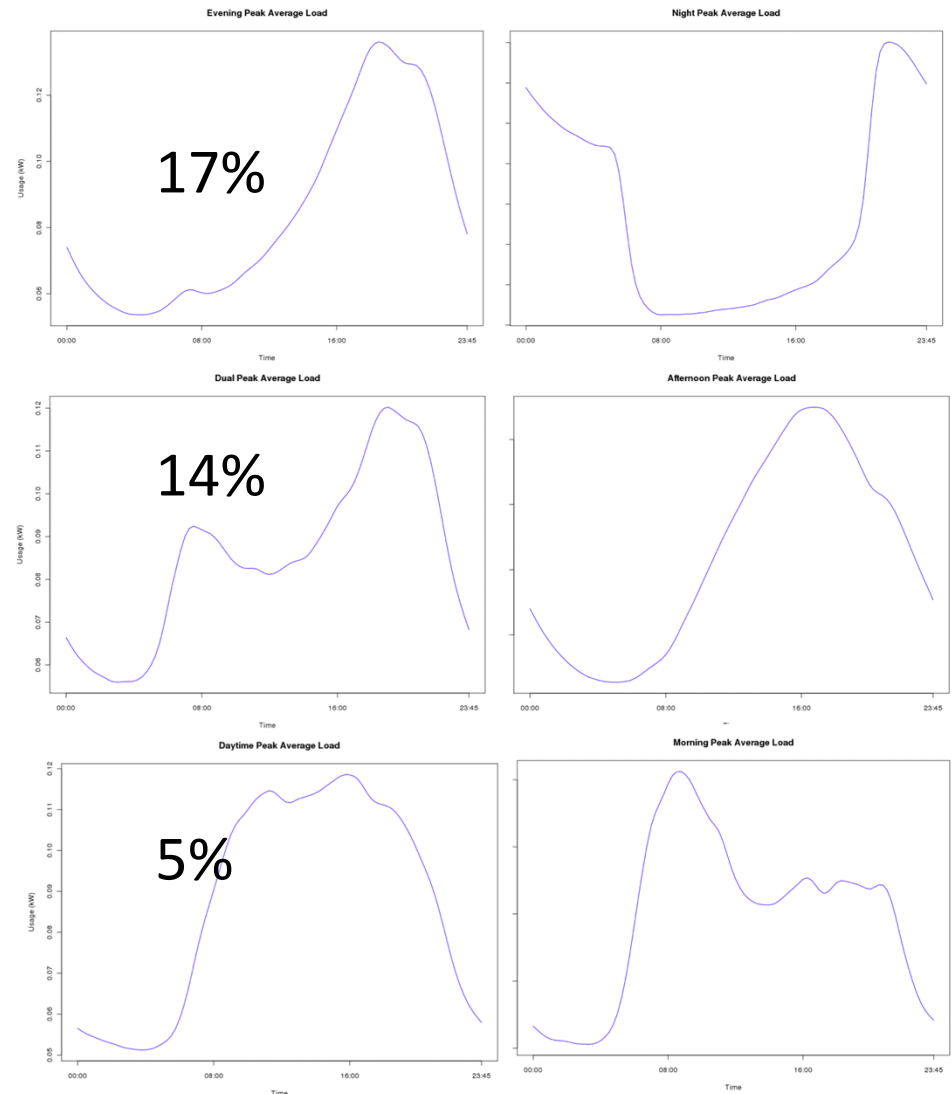

Speed of Analysis for an Alternative

Smart meters show energy consumption of households (homes + occupants)

- Climate zones 12 and 13
- 8,337 households
- 43 weekdays
- (June-July, 2011)

Brian Smith, Jeff Wong and Ram Rajagopal,
A Simple Way to Use Interval Data to Segment Residential Customers by Energy Usage for Program Targeting

Who will “guarantee” what?

I have made all my
generals out of mud.
