# Transformation of Hospital Design after a 'disaster' or 'unforeseen event'

September 8, 2020

Moderated by:

**Cindy Beckham**

**The American  
Institute  
of Architects**

Academy of  
Architecture for Health  

---

an **AIA** Knowledge Community

# Case Study

As part of the Academy's multi-channel, on-line approach, these sessions are intended to introduce members of healthcare-centric practices, in all stages of professional development, to case studies of relevant content, providing access to data and critical analysis of elements key to the project's success.

**The American  
Institute

# Compliance Statement

“AIA Knowledge” is a Registered Provider with The American Institute of Architects Continuing Education Systems (AIA/CES). Credit(s) earned on completion of this program will be reported to AIA/CES for AIA members. Certificates of Completion for both AIA members and non-AIA members are available upon special request.

This program is registered with AIA/CES for continuing professional education. As such, it does not include content that may be deemed or construed to be an approval or endorsement by the AIA of any material of construction or any method or manner of handling, using, distributing, or dealing in any material or product.

**The American

# AIA/CES Reporting Details

Your CES credits from this event will be automatically reported given your engaged attendance during the entire event today.

If you are watching in a group setting and have multiple people in the room, please make sure the person who registered for the course, includes your name and AIA member number in their post webinar survey.

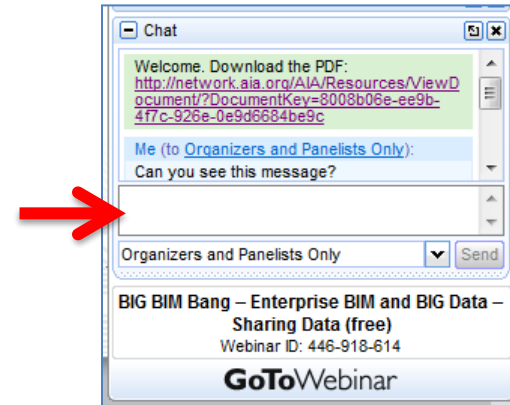

We encourage all registrants to fill out the post webinar survey. Your feedback is important and informs us of future webinar topics to better meet listener needs.

# Questions?

Submit a question to the moderator via the chat box.

Content-related questions will be answered during the Q&A portion, at the end of the presentation, as time allows. Any questions not answered during Q&A, will be answered and posted online within two (2) weeks.

Tech support questions will be answered by AIA staff promptly.

Transformation of  
Hospital Design  
after a 'disaster' or  
'unforeseen event'

# Content

- Background & Methods
- Timeline & Major Events
- Event One: Crimean War
- Event Two: World War II & Rise of Modernism
- Event Three: Rejection of Modernism
- Event Four: Hurricane Katrina & Other Storms
- Current Event: Covid-19
- Takeaways / Summary
- Q&A

# Background & Methods

**Definition of Disaster:** A sudden and unexpected event causing interruption in operation.

Disasters can be classified into three types:

- (1) natural;
- (2) man-made; and
- (3) hybrid

Healthcare delivery should do business as usual considering all the standards of healthcare delivery.

# Disaster & Health System

# Problem Statement

- Sophisticated Building Technologies
- Advanced Information Systems
- Developing Medical Technologies
- Benchmarking Clinical Pathways
- Research Informed Design
- Life-Enhancing Healing Environments

- For **centuries little** except shelter, comfort and prayer could be done to help the sick,
- Only for the last 100 years have we been able to create a **modern healthcare setting** that paces exploding medical advances, building technologies and the skills of compassionate designers,
- Life-enhancing environment where caring professionals are effectively supported as they work to heal the body, mind and spirit.

## Pre-historic Hospital

Lithograph showing Nightingale talking with an army officer at Barracks Hospital in Scutari, 1856

Previous Research

# Timeline & Events

# Timeline & Events

# Event One

## Crimean War

**Dates: Oct 5, 1853 – Mar 30, 1856**

- Influence of Florence Nightingale
- A team of 38 volunteer nurses to care for the British soldiers fighting in the war.
- A golden period with respect to nursing, and
- A great example of modern nursing.
- Changing the nursing career by being more professional and dedicated to patients and played a significant role on soldiers treatment process (Fee & Garofalo, 2010).

# Nightingale Ward

<https://kingscollections.org/exhibitions/specialcollections/nightingale-and-hospital-design/florence-nightingale-and-hospital-design>

Event Two

# World War II & Rise of Modernism

# Changes in the New Century

- Steel Skeleton
- Elevator
- Electrical Lights
- Ventilation

## Changes in care

- Cleanliness
- Trench Warfare
- Blood Transfusions
- Triage
- Anesthetic
- Thomas Splint

Besides the unfamiliar medical needs the war presented

## Changes in Healthcare Delivery

<https://ceufast.com/blog/nursing-and-medicine-during-world-war-i>

Event Three / Transition  
Rejection of Modernism &  
Emergence of  
Post-modernism ...

# Typical Prototypes of Hospitals

## Double Loaded Corridors

One Room Deep  
On Each Side  No Mechanical  
Ventilation

### Efficiency concerns

- No nurse's station concept of decentralized nursing unit staffing
- Each patient's room should become its own nursing station

### First Intensive Care Units

- In 1950, anesthesiologist in Europe, Peter Safar established the concept of "Advanced life support", keeping patients sedated and ventilated in an intensive care environment.

**Air Conditioning became widespread**

## Period of Podium Design

# Changes in Design

- Central nurse stations
- Double loaded corridors
- T shape units

# Event Four

## Hurricane Katrina & Other Storms

## ‘Natural and Man-made Disasters’

	NAME	Name of Disaster	Year
	General Hospital of Everett, Washington	Fire	1987
	12 hospital, Northridge, California	Earthquake	1994
	Rural Community Hospital	Bomb Threat	1999
	Memorial Hermann, Houston, Texas	Tropical Storm	2001
	Hospitals in New Orleans	Hurricane -Katrina	2005

# Katrina Deadly Choices

# MS Thesis Kader (2008)

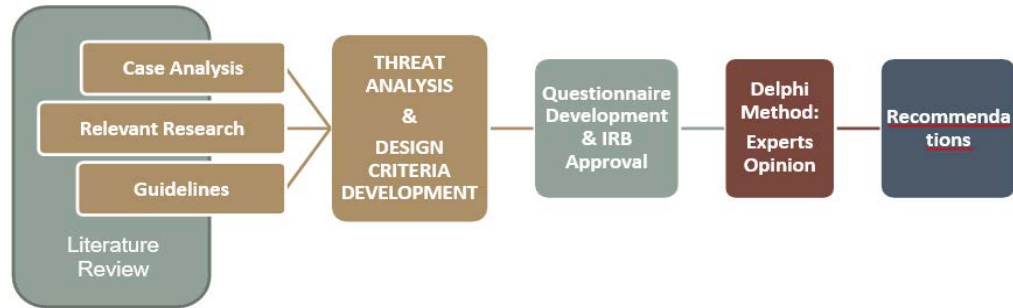

---

Title	DEVELOPMENT OF DESIGN STRATEGIES TO SUPPORT EVACUATION PROCESS OF HOSPITAL BUILDINGS IN UNITED STATES
Objective	To develop to develop design strategies for hospital facilities to support the complete evacuation process during any kind of disaster.

---

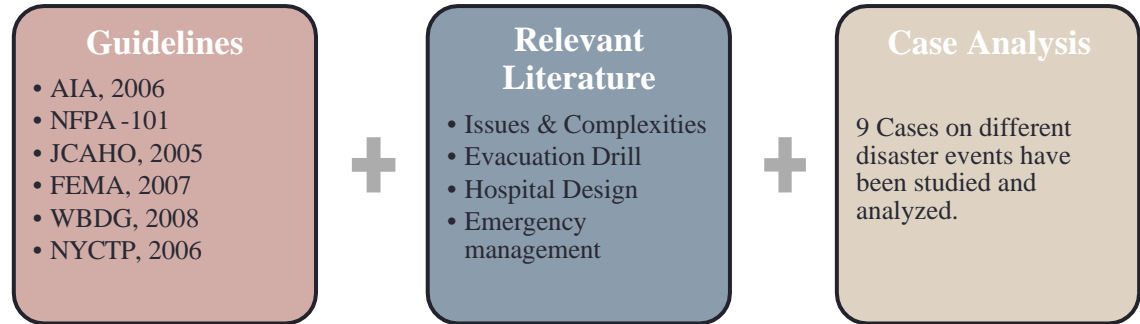

## METHODS

---

# Threat Analysis

Disaster threats for patients' evacuation (types of disaster), Warning period for evacuation (rapid or regular), Evacuate-location (outside building or town), Pattern (full or partial)

## DESIGN PARAMETERS CONSIDERED

The following parameters have been considered in this [study](#):

- a) Evacuation Exit Route (EER)
- b) Site Access (ambulance and helicopter)
- c) Vertical Transportation (elevator, [ramp](#) and staircase)
- d) Emergency Assembly Area (Inside and outside)
- e) Emergency Operation System (EOS)

## 'Lessons Learned'

	NAME	CAUSE	
Case -1	Children Hospital, New Orleans	Hurricane -Katrina	2005
Case -2	Texas Children's Hospital, New Orleans	Hurricane -Katrina	2005
Case -3	Tulane University Hospital, New Orleans	Hurricane -Katrina	2005
Case -4	Charity Hospital, New Orleans	Hurricane -Katrina	2005
Case -5	Rural Community Hospital	Bomb Threat	1999
Case -6	12 hospital, Northridge, California	Earthquake	1994
Case -7	12 hospital, Northridge, California	Earthquake	1994
Case -8	A 28-bed intensive care unit, Memorial Hermann	Tropical Storm	2001
Case -9	General Hospital of Everett, Washington	Fire	1987

# Findings

[illegible]

# ‘Issues and complexities’ of hospital evacuation

**Nature of Threats:** Evacuation process depends on the threat’s severity, urgency of evacuation required, and ability to function during the evacuation. Among them, the evacuation warning time is the most important factor. For example, hurricanes and floods present threats that may allow some time for evacuation, but tsunamis allowing less time and earthquakes, tornados, and building fires almost none at all.

**Risk to ICU Patients:** ICU patients may have severe condition for evacuation, tend to be shelter-in-place. Also, staff injury and fatigue due to patients’ transfer during disaster.

**Threat Probabilities and Timing:** Evacuation timing depends on threat probabilities. The amount of notice before evacuation is an important factor in the evacuation’s success.

**Continuing Care:** Hospital should provide continuous care for patients’, whom they cannot discharge during evacuation.

**Resource Demand:** Evacuation requires resources, such as, 3 to 5 person to transfer one ICU patients, transportation, medical professionals, emergency supplies. But hospital does not possess these amounts of resources for routine operations. So, during evacuation the crisis of resources is an important issue.

# Recommendations

## Mass Evacuation

Mass evacuation is mainly required for hurricane, earthquake, wildfire, volcanic eruption, extreme heat, winter storm, landslide, and terrorism.

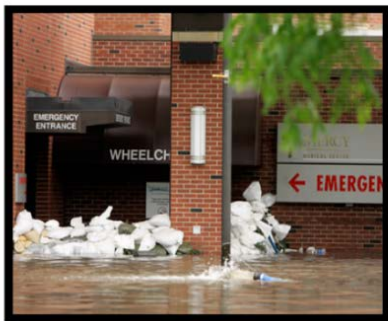

The University of Texas Medical Branch, UTMB Hurricane IKE, 2008

Multiple accesses to the site will be beneficiary to accommodate lots of transportation, and it also increases safe entry and exit. Since, it depends on hospital location and site, for dense urban areas the accesses can be limited. During mass evacuation hospital may have external visitors, staff or patients' family, so that hospital facilities should have flexibility to accommodate extensive services. Patients' safety is one of the major criteria.

The sketch is showing a hospital with recommended design considerations in a mass evacuation scenario.

### Multiple Accesses Require

In flood affected area, hospital could be surrounded by water, which may impair the ground evacuation. Hospitals should have multiple exit routes distributing in different levels.

Mercy Medical Center in Cedar Rapids, Iowa.

### Ground Evacuation

The facility should have provisions to access the boats to transfer patients'. A ramp connecting upper level with ground could be an alternative solution.

Memorial Hospital, New Orleans (Hurricane Katrina, 2005)

### Air Evacuation

Location of helipad should be specific. Ground helipad should be avoided for flood. For earthquake, ground helipad with a safe distance from the building is better. Sometimes the hospital roof top is the only choice, but if possible the garage top can be a better option which can be connected with the hospital building in upper level.

Workers move patients up the stairs from the parking garage to the helipad to be evacuated from Memorial Medical Center in New Orleans on Sept. 1, 2005

# Recommendations

### Vertical Evacuation: Elevator

The elevator is the practical way to transfer patients vertically. Elevator use is restricted only for fire. The fire fighter can examine and use the elevator for evacuation. It requires alternative solution. The operation of elevator should be protected from any kind of hazards.

The last stoppage should be above the flood level. The number of elevator (big one) should be more than the minimum number mentioned in standard.

The Sketches are showing two scenarios; during fire hazard, elevator cannot be use for vertical evacuation and during hurricane Katrina a New Orleans hospital faced the elevator in water problem.

### Vertical Evacuation: Stair

Stairwell is the practically alternative solution of elevators. Stairwell design should consider the turning radius of various specialized devices, such as Backboard, Stretcher, or Scoop Stretchers.

Charity Hospital, Hurricane Katrina, 2005.

- Stairwell design should consider the turning radius of various specialized devices, such as Backboard, Stretcher, or Scoop Stretchers.
- Flashlights should be in all units and stairwells with proper hanging system.

## Recommendations

A hospital facility requires two types of assembly areas; inside and outside. Hospital should have outside assembly areas for any kind of internal hazards to gather patients. It can be parking lot, terrace top, roof top or any elevated platform; need to be threat specific. For fire, explosion or earthquake, it can be at a safe distance from the building. It can be designed with shading device to protect them from sun or rain.

### Outside Assembly Area

The sketch is showing that how a outside assemble area can works during fire hazard.

### Inside Assembly Area

Charity Hospital, Hurricane Katrina, 2005.

Any function can be considered as an assembly area during disaster. It should have adequate outlets and supply to provide continuous care. Emergency department can be a good choice, it should have the provision separating the contagious patients. Also it should be located near to the exit point, to transfer patients quickly.

### Emergency Power Supply

Emergency power supply should be protected from any kind of hazards to provide continuous support for evacuation, especially for elevator. This system should be located in a secure place, such as; the switch gear or generators should be located above the flood level.

### Connections between Buildings

In hospital complex design, it is wise to connect one building with others in different levels, specifically, where the critical patients are located to avoid the vertical evacuation.

Memorial Hospital, New Orleans (Hurricane Katrina, 2005)

# Recommendations

# Recent Disaster Events

- **Hurricane Florence in Fall 2018** - has led to the closure of numerous care facilities across the Carolinas. The City of Wilmington was even completely cut off from outside access for days due to flooding.
- **Hurricane Irma in Fall 2017:** 12 residents of a Florida nursing home died during this hurricane, when the building's central air conditioner failed and led to extreme overheating.
- **Hurricane Harvey in 2017:** 60 inches of rain and strong wind to the Houston, around 20 hospitals in the area had to close or evacuate - estimated disaster-related costs totaled \$460 million.

# Design Strategies

scenarios	strategies
<b>Hurricanes and Tropical Storms</b>	<ul style="list-style-type: none"><li>• Impact-resistant glass</li><li>• Water storage tanks</li><li>• Extra on-site backup power</li></ul>
<b>Storm Surge, Sea Level Rise, and Flooding</b>	<ul style="list-style-type: none"><li>• Locating power center and HVAC equipment above the storm surge elevation or floodplain levels</li><li>• Landscape elements such as berms, swales and/or natural wetlands</li></ul>
<b>Extreme Heat and Cold</b>	<ul style="list-style-type: none"><li>• Strategic siting and shading of the building to reduce heat gain</li><li>• Super-insulated building envelopes</li><li>• Operable windows</li></ul>
<b>Drought</b>	<ul style="list-style-type: none"><li>• Graywater recycling features</li><li>• Rainwater cisterns</li><li>• Xeriscapes with native trees and shrubs</li></ul>

## Hospital Design Related Challenges

# Post COVID-19 Hospital Design

## 10 Areas Where Change Coming

1. Improving infection prevention.
2. Increasing isolation room capacity.
3. Limiting shared staff spaces.
4. Triaging patients before they enter the ED.
5. Waiting rooms and public spaces.
6. Planning for inpatient surge capacity.
7. Increase surge capacity in outpatient centers.
8. More storage areas for supplies.
9. Facility Size: Breaking into small structures.
10. Isolation operating rooms and cath labs.

# 1. Improving infection prevention

- **Selection of materials:**
  - Nonporous materials
  - Easily cleanable
  - Withstand harsher chemicals
- Use of UV light or sterilizing mists in high and medium risk areas.
- Low risk areas, such as exam rooms, need thorough cleaning protocols and room turnover process – which will influence future planning and programming

## 2. Increasing isolation room capacity

- Allocate a groups of rooms / entire units / wings that can be negatively pressurized
- Have the scope to cut off or separate these isolation areas from the other parts of the hospital.
- Easily accessible entrance/exit from ED or outside triage.
- Design areas where staff can remove PPE without contaminating other areas outside isolation room.

### 3. Limiting shared staff spaces

- Number of occupancy rates need to be reconsidered for dedensification purpose.
- Rethinking size of staff areas and workstation.
- Staff Break Room – Large areas may be eliminated in favor of smaller and more discrete spaces.
- Administrative department may move to off-site.
- Design more recreational and private spaces for the staff, also outdoor separate areas only for staff.

## 4. Triageing patients before they enter the ED

- Design ways to triage people outside for they come to front door.
- May require multiple entries and waiting solutions.
- Design separate circulations (if possible).

## 5. Waiting rooms & public spaces

- Design self-check-in booth or self-rooming system - to reduce close contact among unknown people.
- Rethinking of waiting room: breaking it into small parts, more private, reducing size as patients may encouraged to wait outside, or in their car.
- Common spaces, waiting rooms, lobbies, and dining facilities will need to design with greater physical separation between people, with appropriate queuing.

## 6. Planning for inpatient surge capacity

- Med-gas, E-power, HVAC, and other equipment – need to design in such a way so that patient room and other spaces can accommodate more patients.
- Two beds in single-patient room.
- Surgical Prep and PACU to ICU.

## 7. Increase surge capacity in outpatient centers

- Ambulatory Care Facility can easily convert into facility to accommodate surge capacity, with fewer disruptions, than the field hospitals being erected in hotels and convention centers.
- While designing outpatient clinics, freestanding EDs, and ambulatory surgery centers, we need to consider this scenario or pandemic for future.

## 8. More storage areas for supplies

- Hospitals/health systems will seek greater control of their own supply chain and may stockpile key supplies, equipment, and medication to avoid future supply shortages.
- Design facilities to house these inventories

## 9. Facility Size: Breaking into small structures

- The desire to break apart some of the functionality of a large hospital and spread it out into other facilities-like oncology centers or ambulatory surgery centers will grow - to reduce the large population at one building.
- Designing facilities where you have people sitting further apart, you have smaller waiting areas, perhaps, instead of a big, large emergency room waiting area where everyone's sitting side by side.
- The future as telemedicine reduces the need for exam rooms, waiting rooms, and support spaces.

## 10. Isolation operating rooms and cath labs.

- The Centers for Disease Control and Prevention guidelines - an infectious patient require that the operating room remain positively pressurized throughout the surgery, and that no activity takes place within the room for an extended time after intubation and extubation.
- As it extends the length of surgical cases and limit staff mobility in and out of the room before, during, and after cases.
- More hospitals will want ORs and cath labs.
- More anterooms from OR to both the hallway and surgical core or control room.

# SUMMARY

# Resilient Design

## **Per the Resilient Design Institute:**

“resilience is the capacity to adapt to changing conditions and to maintain or regain functionality and vitality in the face of stress or disturbance. It is the capacity to bounce back after a disturbance or interruption.”

<https://www.resilientdesign.org/what-is-resilience/>
