PROJECT NAME

Enchanted Storybook Castle

PROJECT TYPE

New Construction

PROJECT LOCATION

Pudong New District, Shanghai, China

OVERALL HEIGHT

60 meters (196.8 feet)

NUMBER OF FOUNDATION PILES

1,076

NUMBER OF DESIGN DISCIPLINES

142

GROUNDBREAKING DATE

April 8, 2011

TARGETED OPENING

Late 2015

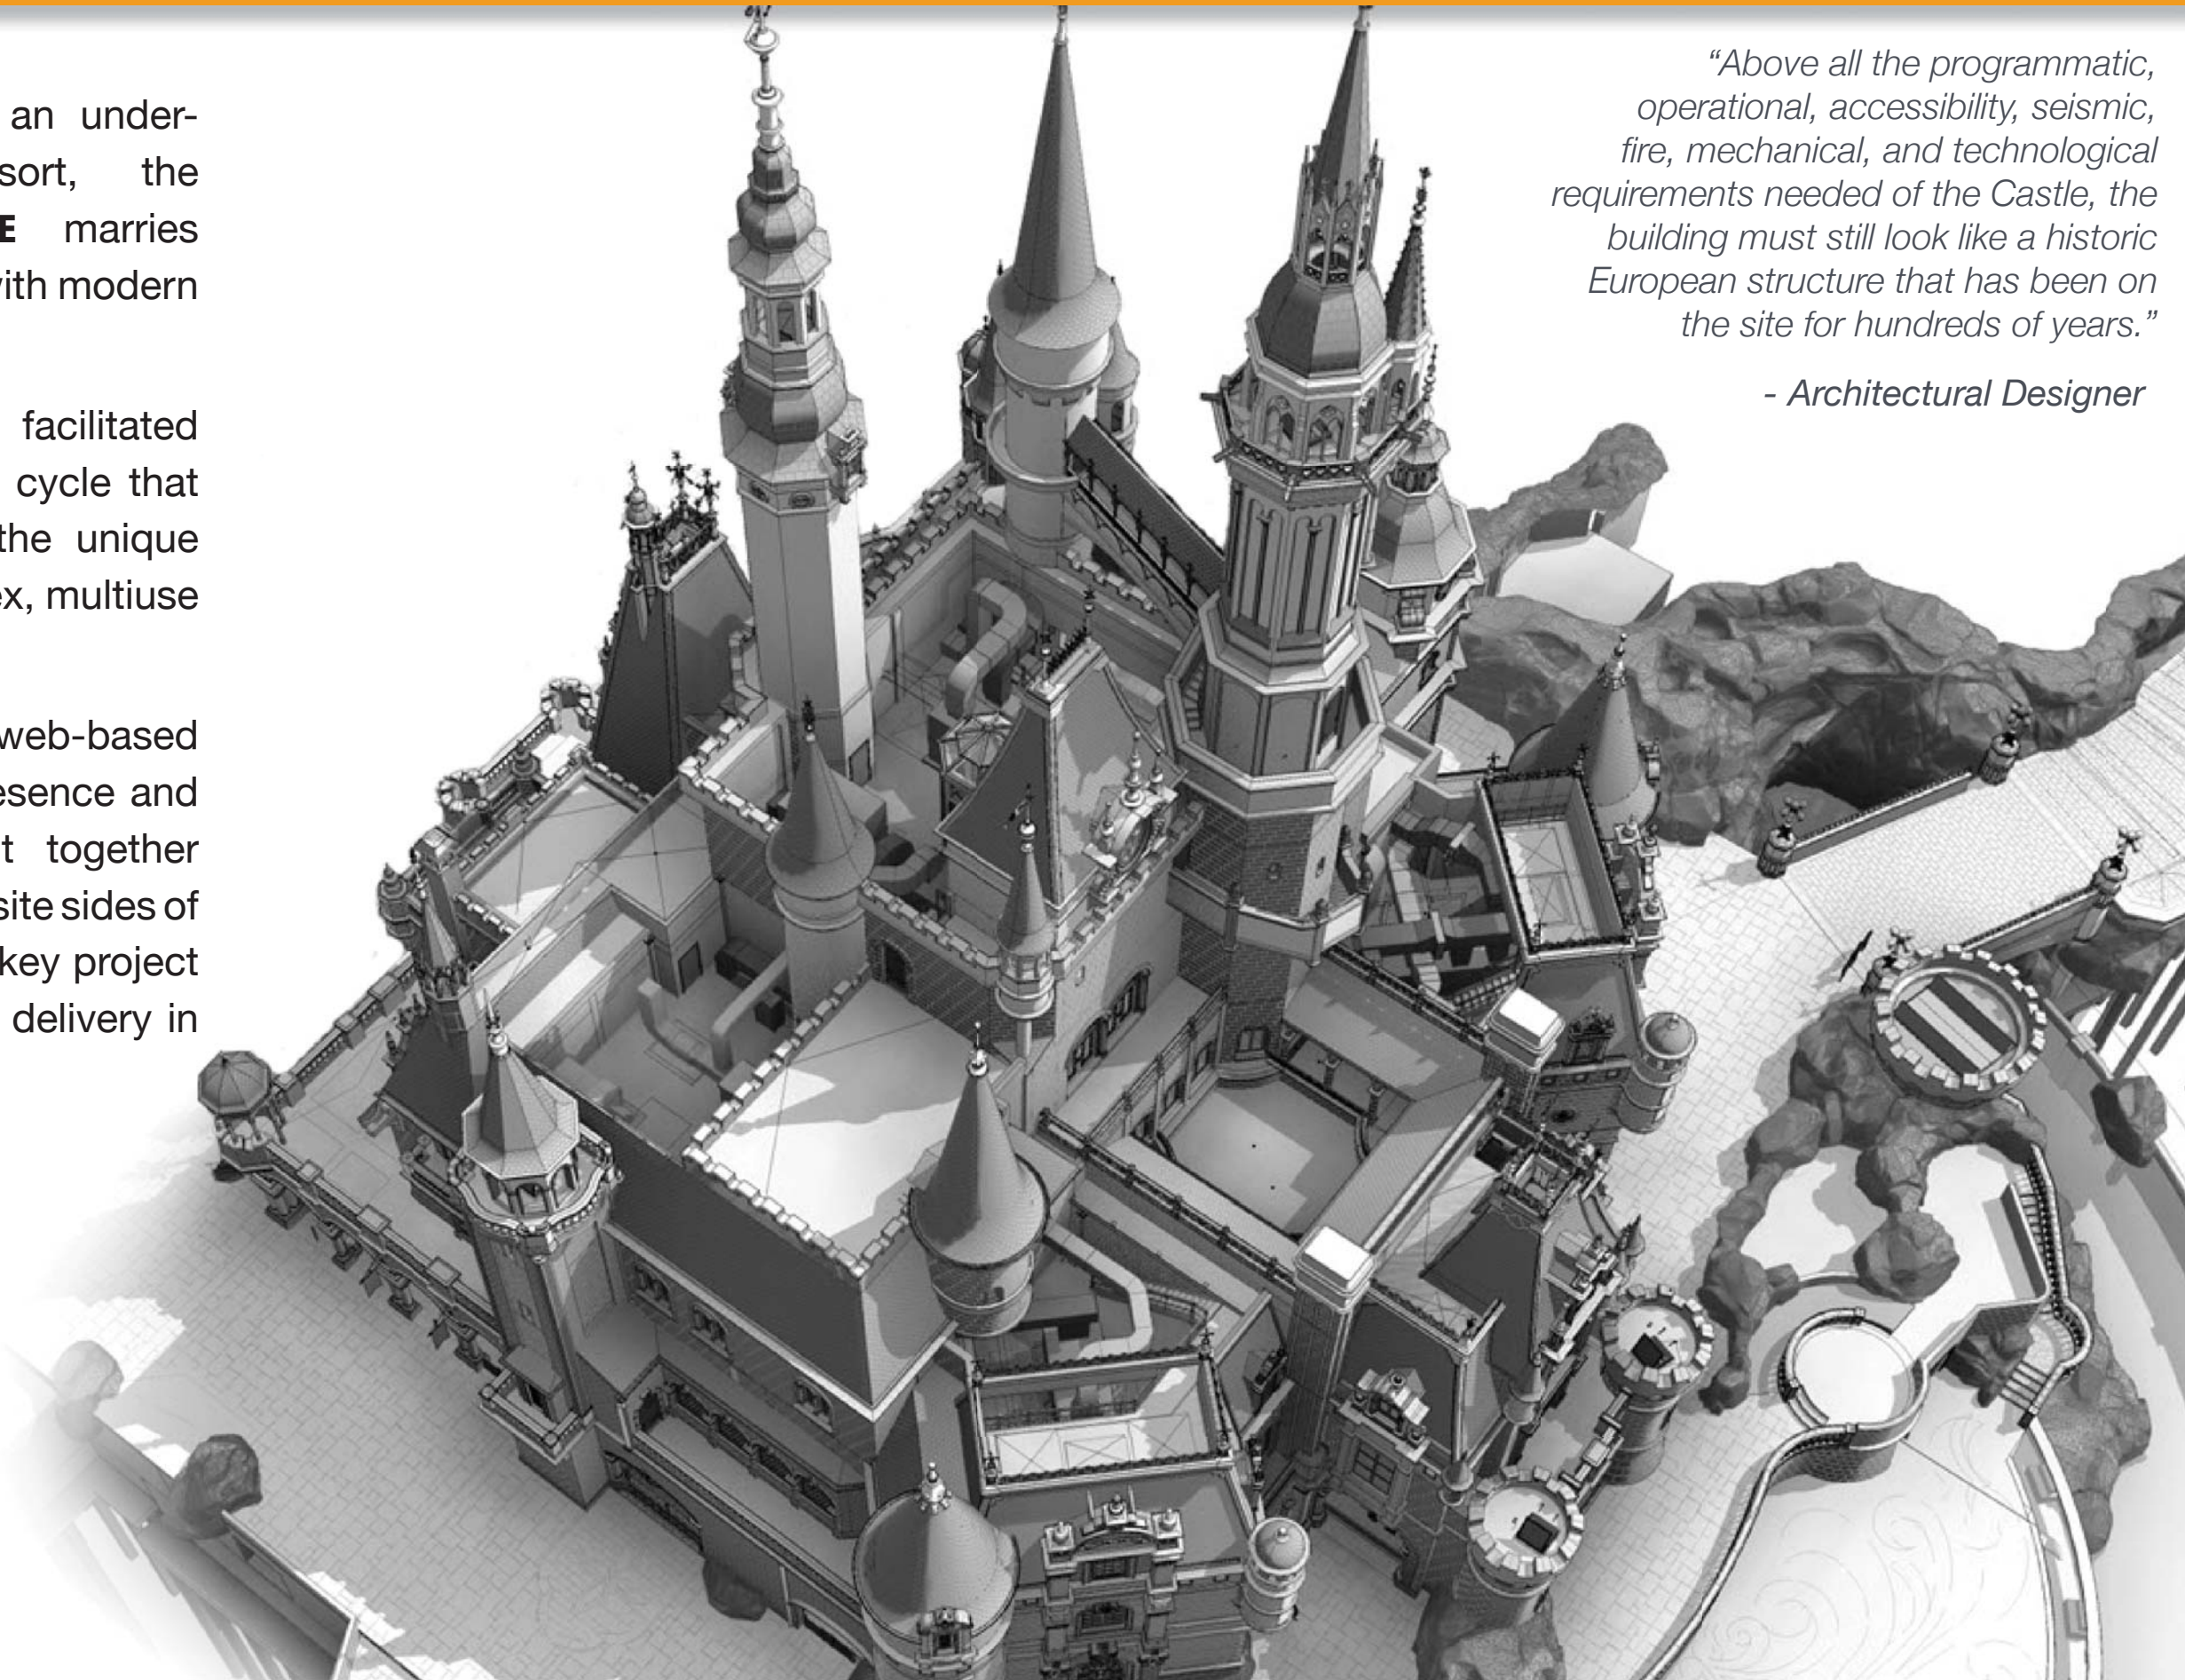

Serving as the centerpiece for an under-construction international resort, the **ENCHANTED STORYBOOK CASTLE** marries traditional architectural detailing with modern building technology.

BUILDING INFORMATION MODELING facilitated a real time testing and feedback cycle that helped the project team meet the unique challenges in realizing this complex, multiuse facility.

BIM enabled collaboration using web-based social collaboration, video-telepresence and cloud-based computing brought together dozens of team members on opposite sides of the globe allowing them to reach key project milestones ensuring a successful delivery in **LATE 2015**.

“Above all the programmatic, operational, accessibility, seismic, fire, mechanical, and technological requirements needed of the Castle, the building must still look like a historic European structure that has been on the site for hundreds of years.”

CHARACTER MEET & GREET

**ONE COMPLEX MODERN FACILITY
WITH HISTORIC ARCHITECTURAL DETAILING**

Initially, the facility was fully modeled in 3D AutoCAD. The team ran into several limitations with the software, so the project was quickly transitioned to and rebuilt as a full BIM model in Revit.

Early in the process, it was evident that a BIM software tool, Revit, had more advantages than the Autocad Architecture software.

Frozen AutoCAD Architecture Model
Front Elevation

Final AutoCAD Front Elevation with
20 hours of cleanup and manual linework

VERSUS

Automatic 2D Drawing Generation from BIM Model
30 minutes of cleanup

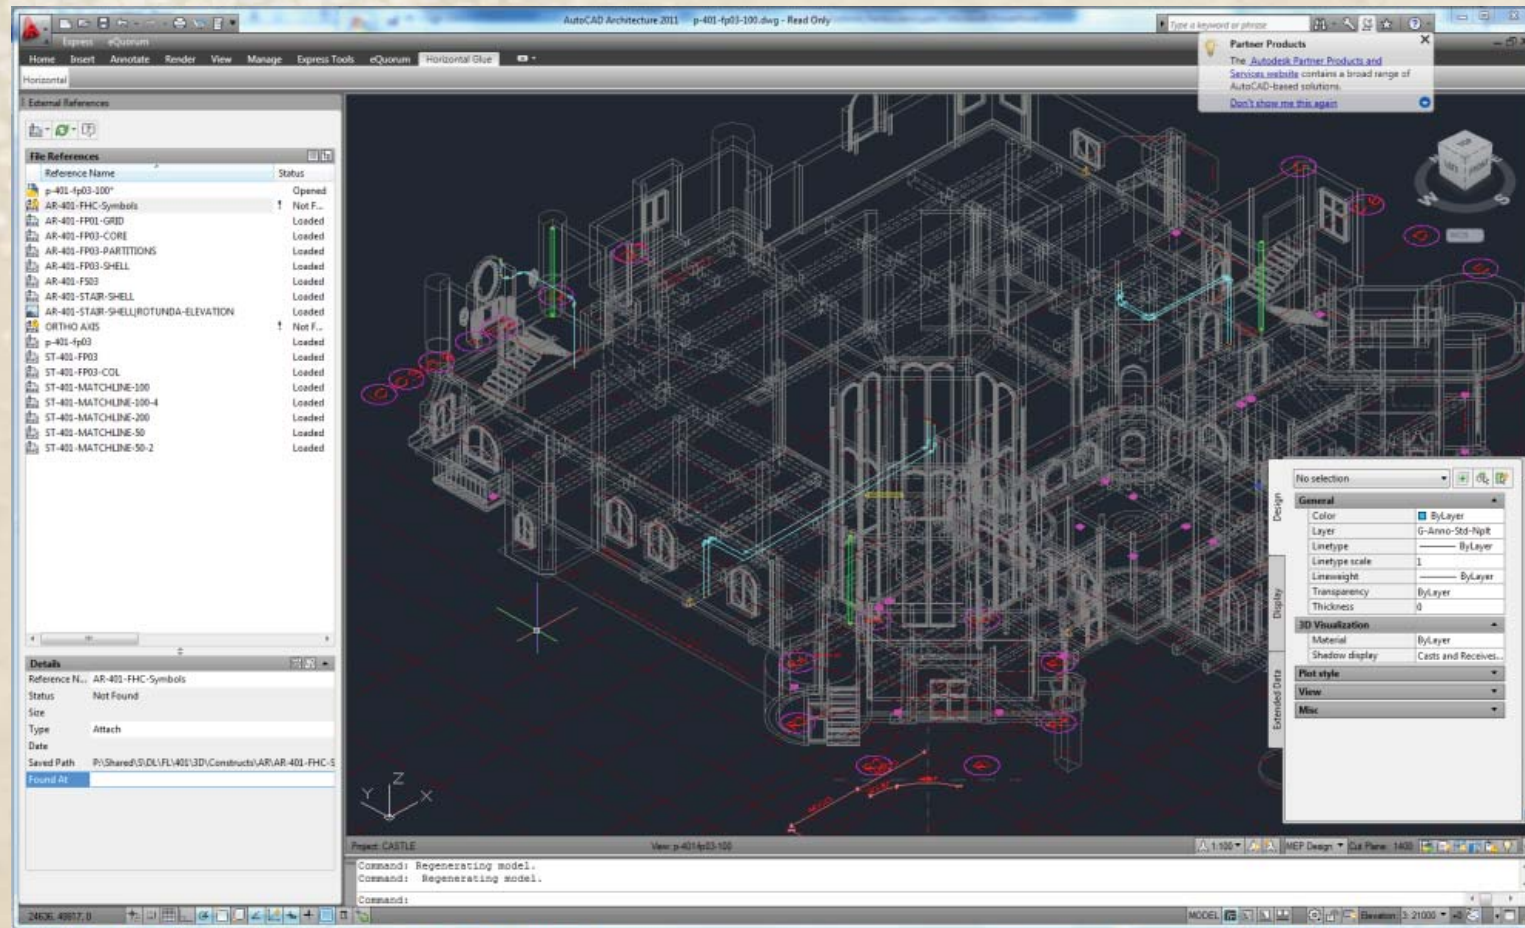

20 HOURS/ELEVATION X 4 = 80 HOURS/RELEASE

20 MINS/ELEVATION X 4 = 2 HOURS/RELEASE

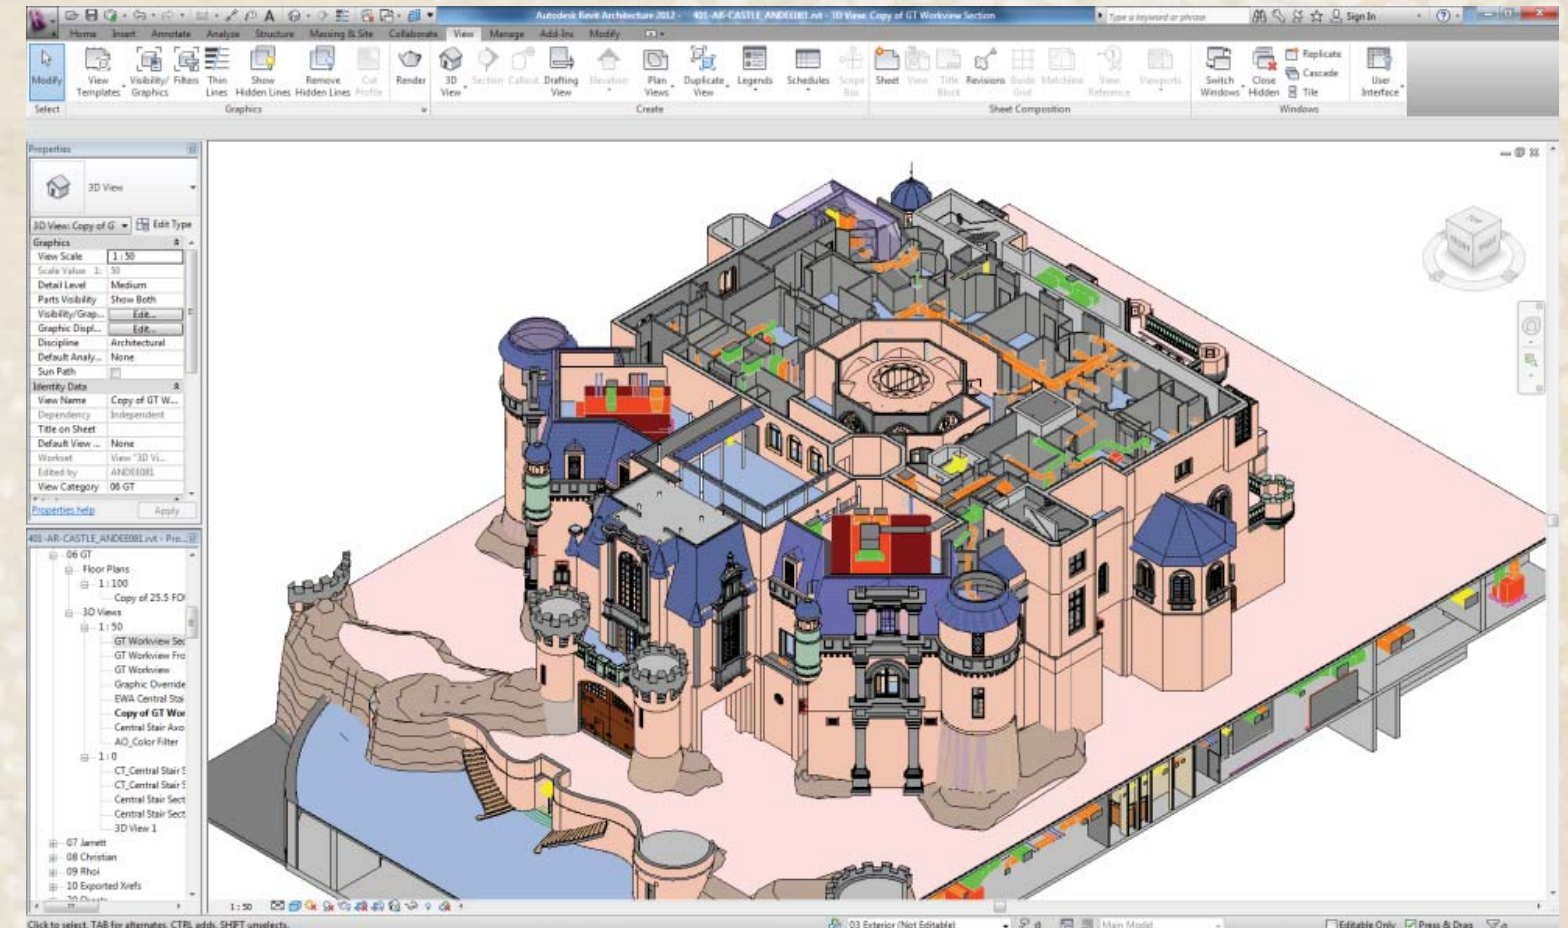

Without a software package that was truly BIM, the Architecture team spent hundreds of hours duplicating effort in order to produce acceptable drawing packages. By switching to a BIM solution, many time consuming steps could be omitted from the traditional clean-up process. Instead of manually adjusting each 2D drawing, the drawings exported from the BIM model .

Sharing data from AutoCAD proved to be a time consuming process. Without a BIM model, it was difficult to create accurate, realistic, and quick visualization studies to share between all disciplines, gather quantity-take off information for our project estimators, and track and coordinate architectural ornamentation with our outside vendors.

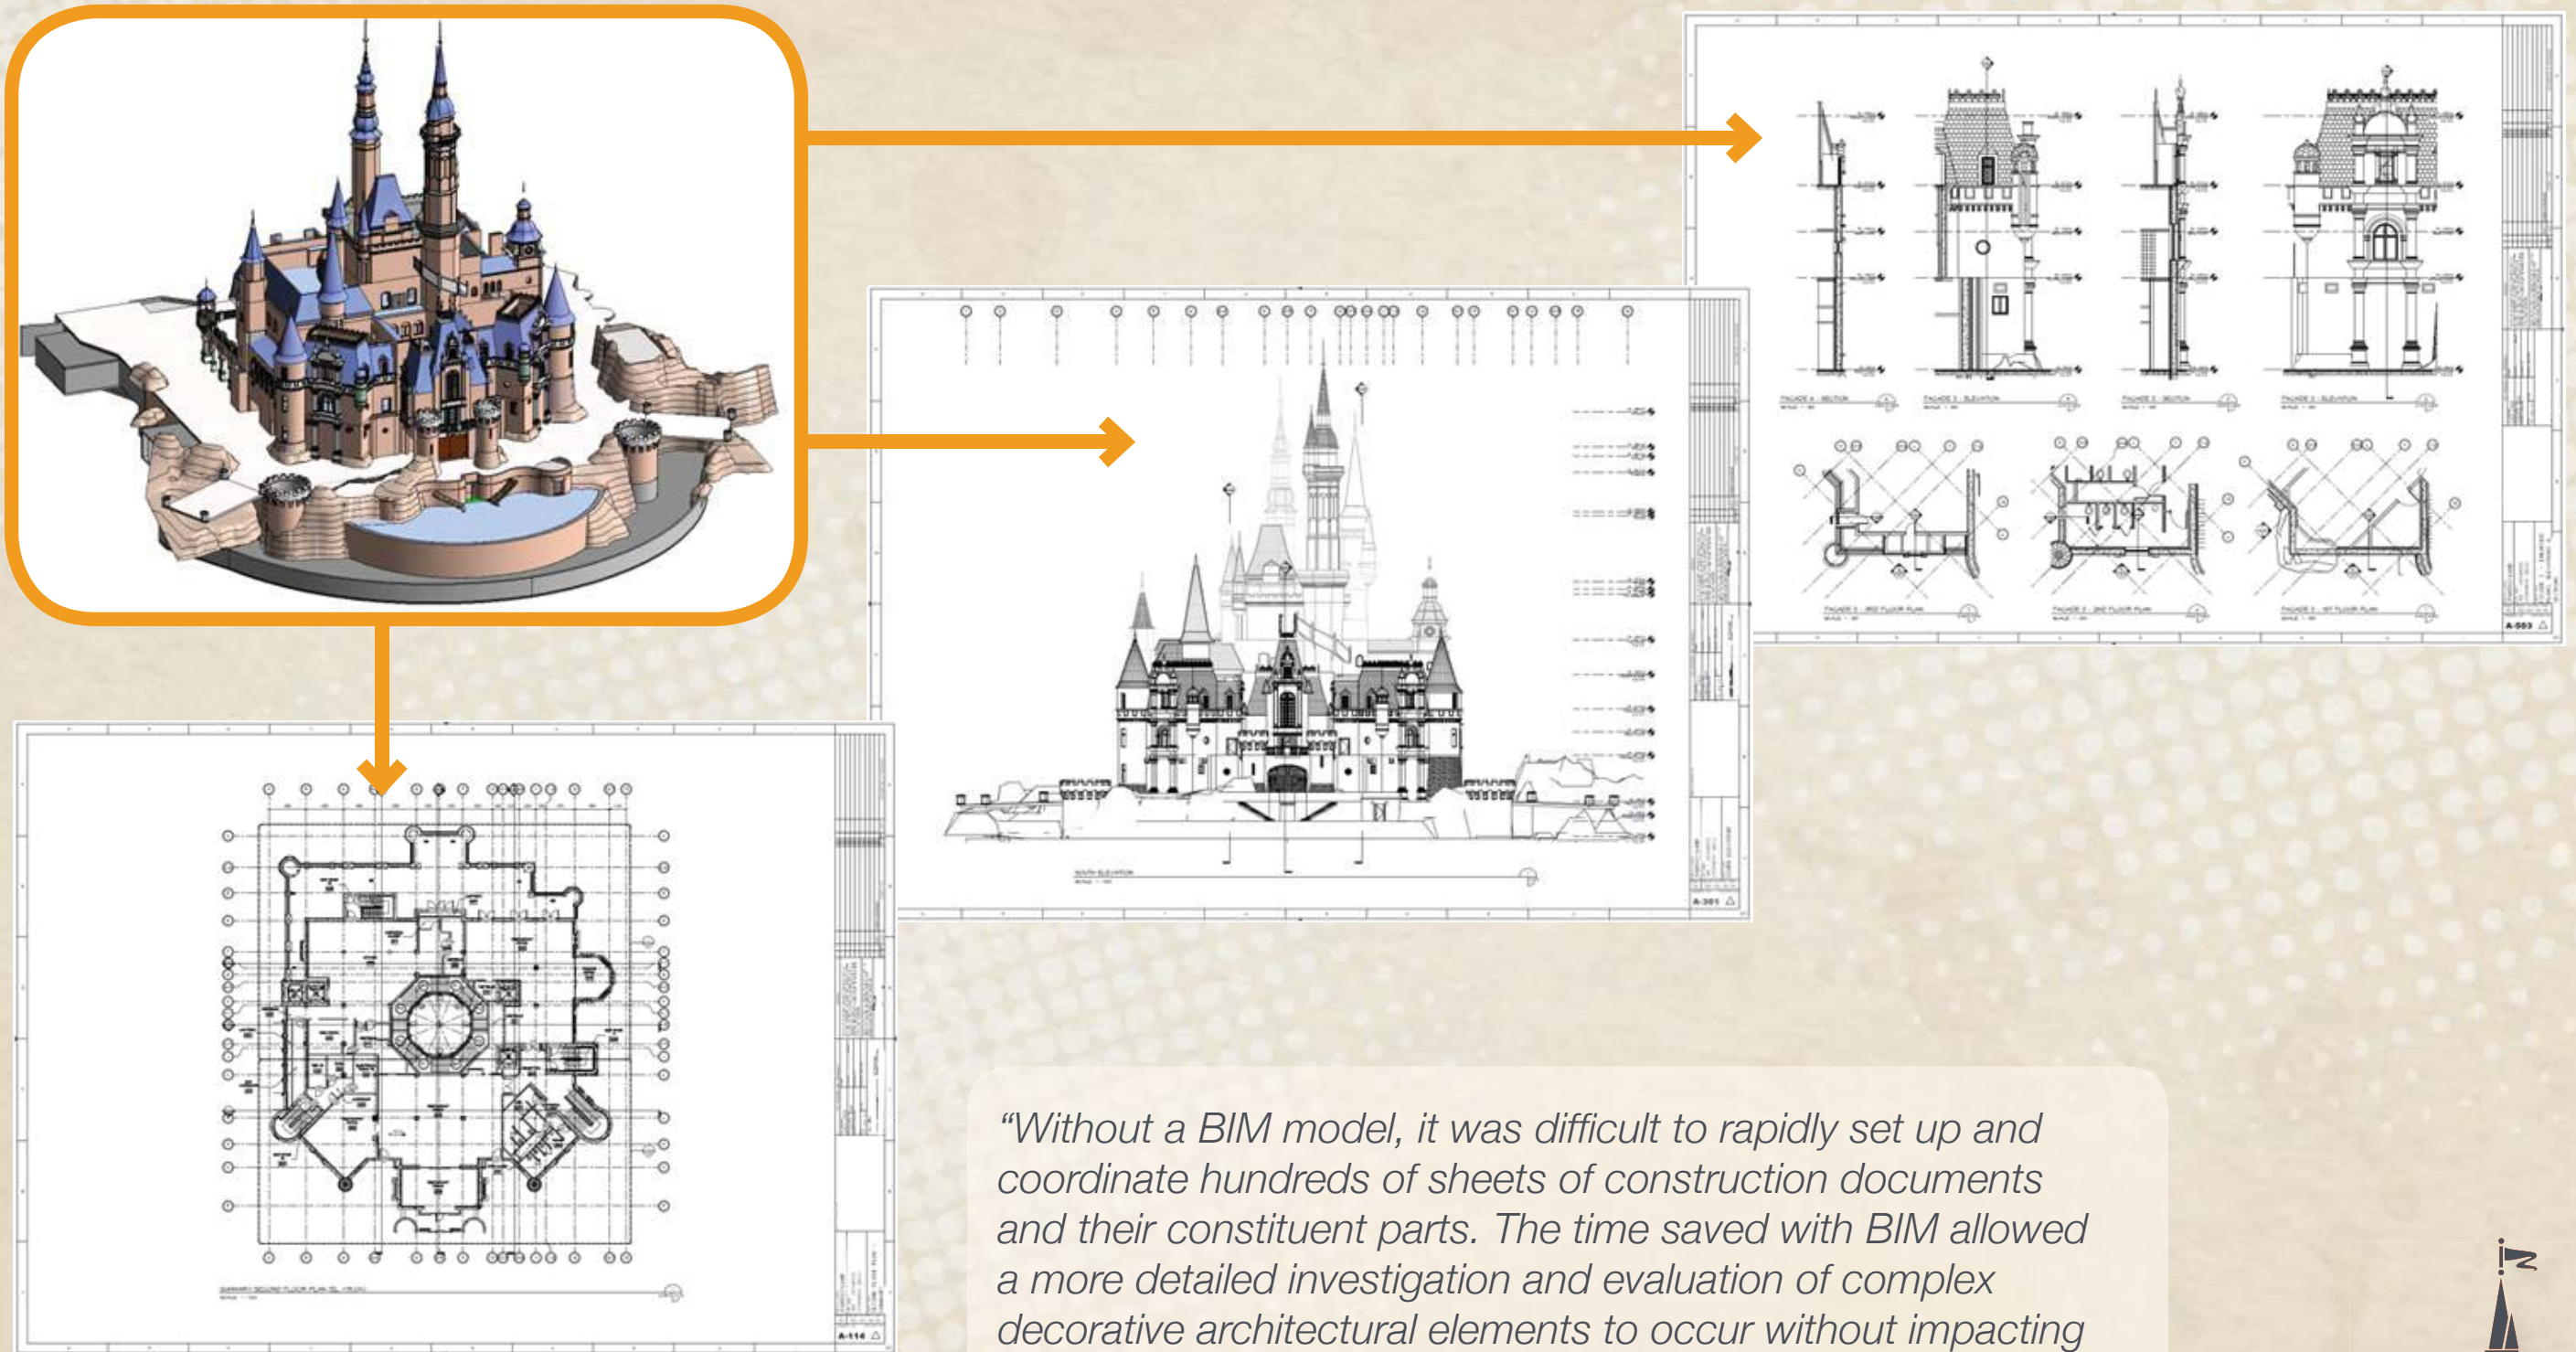

AutoCAD Architecture Wireframe
Lacks necessary information

Revit Architecture Shaded View
More realistic view, includes all information

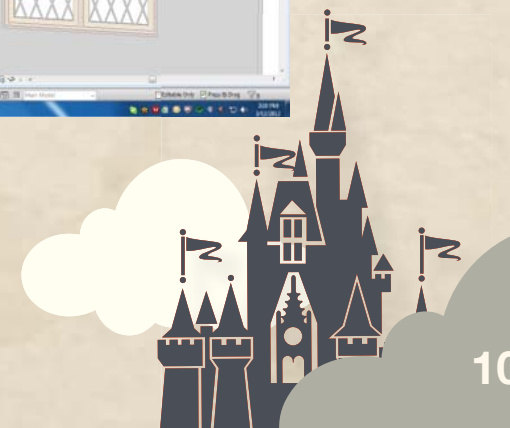

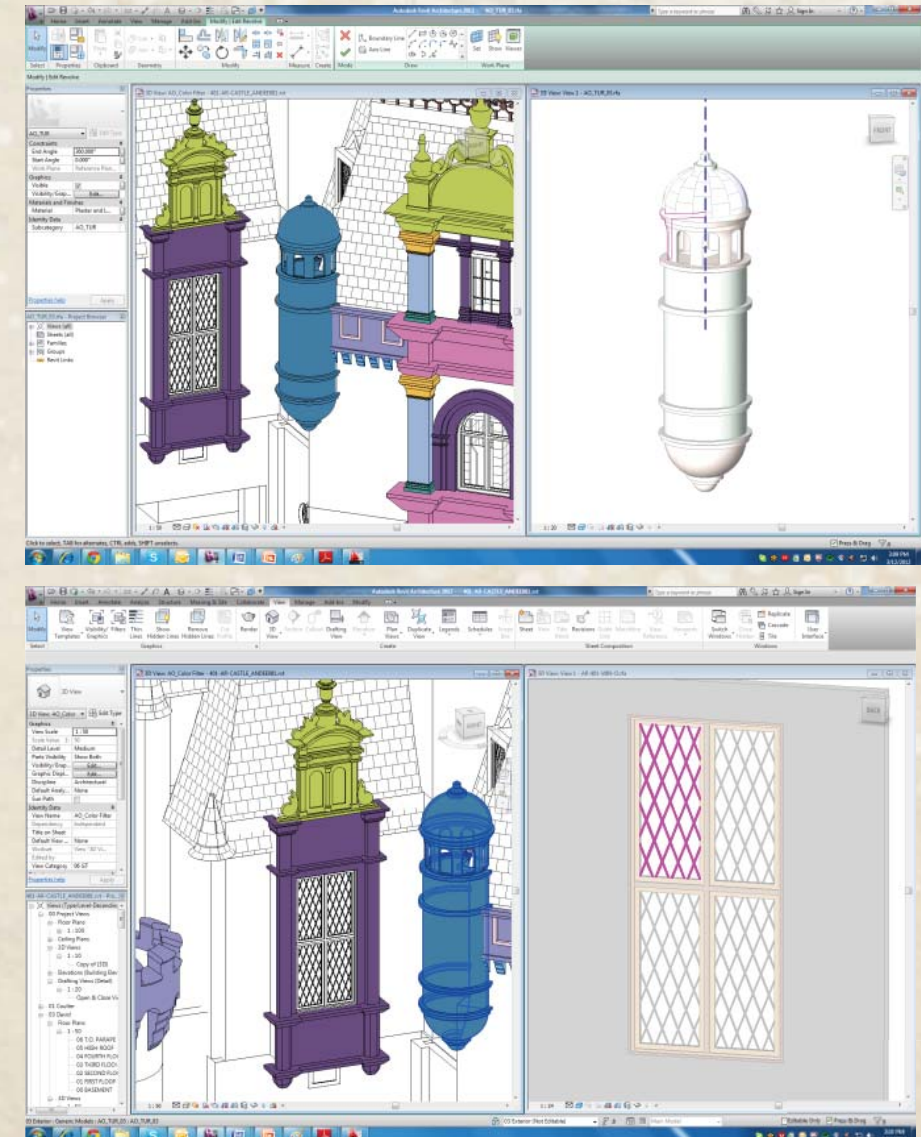

"Without a BIM model, it was difficult to rapidly set up and coordinate hundreds of sheets of construction documents and their constituent parts. The time saved with BIM allowed a more detailed investigation and evaluation of complex decorative architectural elements to occur without impacting project schedule."

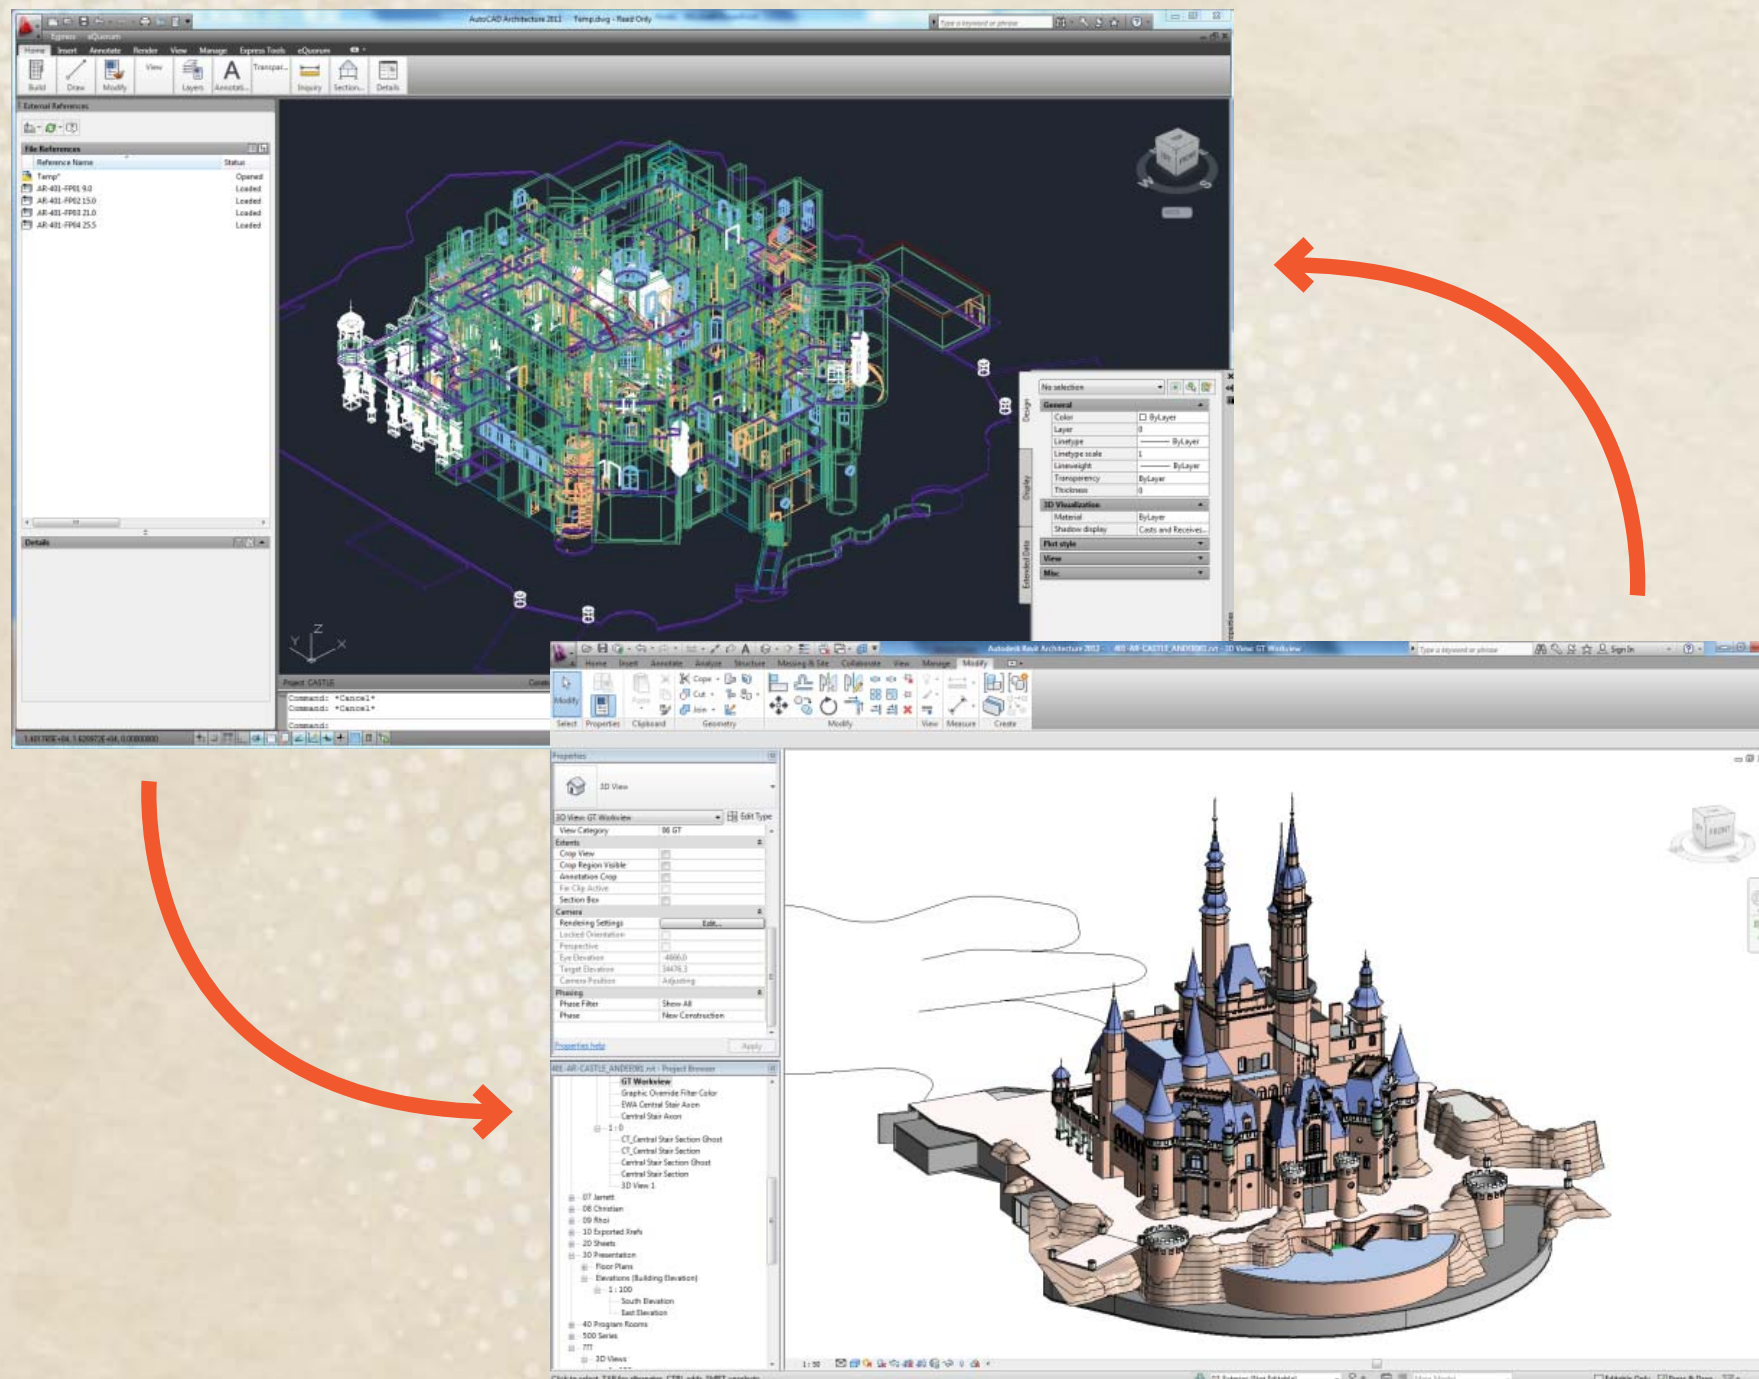

-Concept Architect

At the onset of the project, team members had varying degrees of skill using Revit. In response, a BIM Coordinator was hired to ease the transition. During Design Development, software learning sessions were provided twice a week, allowing the team to get project-specific training. It gave team members immediate opportunities for questions and answers.

Although the architectural team made the conversion to Revit, the Structural and MEP disciplines continued to use AutoCAD. In order to facilitate data exchange between the disciplines, an in-house workflow was developed. Custom scripts allowed our Revit and AutoCAD files to easily and automatically provide a daily output of architectural Revit information for other disciplines.

2D Revit Export Drawings

Structure Backgrounds without extra clean-up.

Previously when using AutoCAD Architecture, 2-3 days of cleanup were needed each time Architecture provided Structures with an xref. Our custom scripts allowed Revit to export automatic, cleaned-up xrefs, allowing for concurrent design rather than a 2-3 day latency in design.

142 disciplines - each with its own team - worked on opposite sides of the globe to design the project. Because of issues with internet connectivity in China, Buzzsaw was used to transfer updates to the BIM model back and forth between the U.S. and China.

Now that our model was properly set up, a BIM “surge team” assisted in creating intelligent, parametric content within the Revit Model

Shanghai Castle Architectural Ornamentation Codes

Color	Code	Name	Description
	AO_CAP	Capital	Head of a pillar or column
	AO_CAR	Character	Character Busts or Sculpture
	AO_CBL	Corbel	A projection to support a structure above it.
	AO_COL	Column	Does not include capital or plinth/base
	AO_CRS	Cresting	Ornamental sculpture pattern elements on top of a roof
	AO_ENT	Entablature	Horizontal continuous lintel above columns
	AO_FIN	Finial	Ornament at the apex of a roof or similar structure
	AO_FRZ	Frieze	Broad horizontal band of sculpted decoration
	AO_PED	Pediment	Triangular element surmounting a portico of columns
	AO_PLI	Plinth	Base of column or other element
	AO_SPN	Spandrel	Zone above an arched window
	AO_TRM	Trim	Linear decorative elements typically along the edge
	AO_TUR	Turret	Small tower attached to a larger building element
	AO_DOM	Dome	A rounded vault forming a roof or ceiling
	AO_WTR	Window Trim	Trim elements surrounding windows

"We used BIM to track and manage items such as the manufactured architectural items and architectural ornamentation for the facility, and coordinated breakpoints for fabrication of the structural Towers with the factory produced glass fiber reinforced concrete components. This aided our Scheduling and Planning team to work out logistic lay down and craning areas to support construction."

-Project Manager

Teams were able to work on different elements of the model. The separate files were then Revit model organized to facilitate work sharing.

Architecture Core and Shell

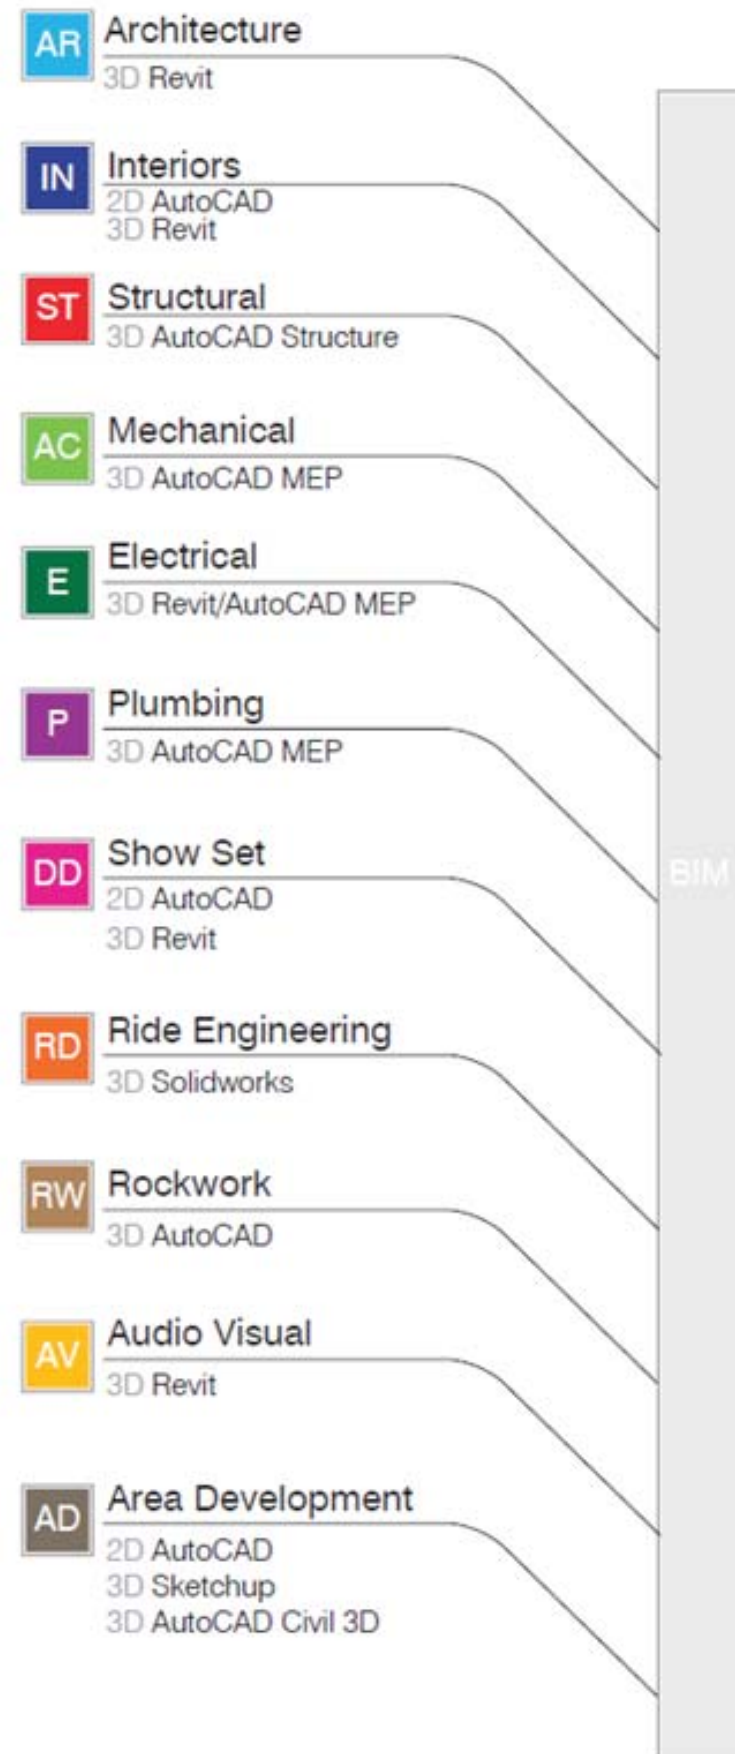

Architecture Ornamentation

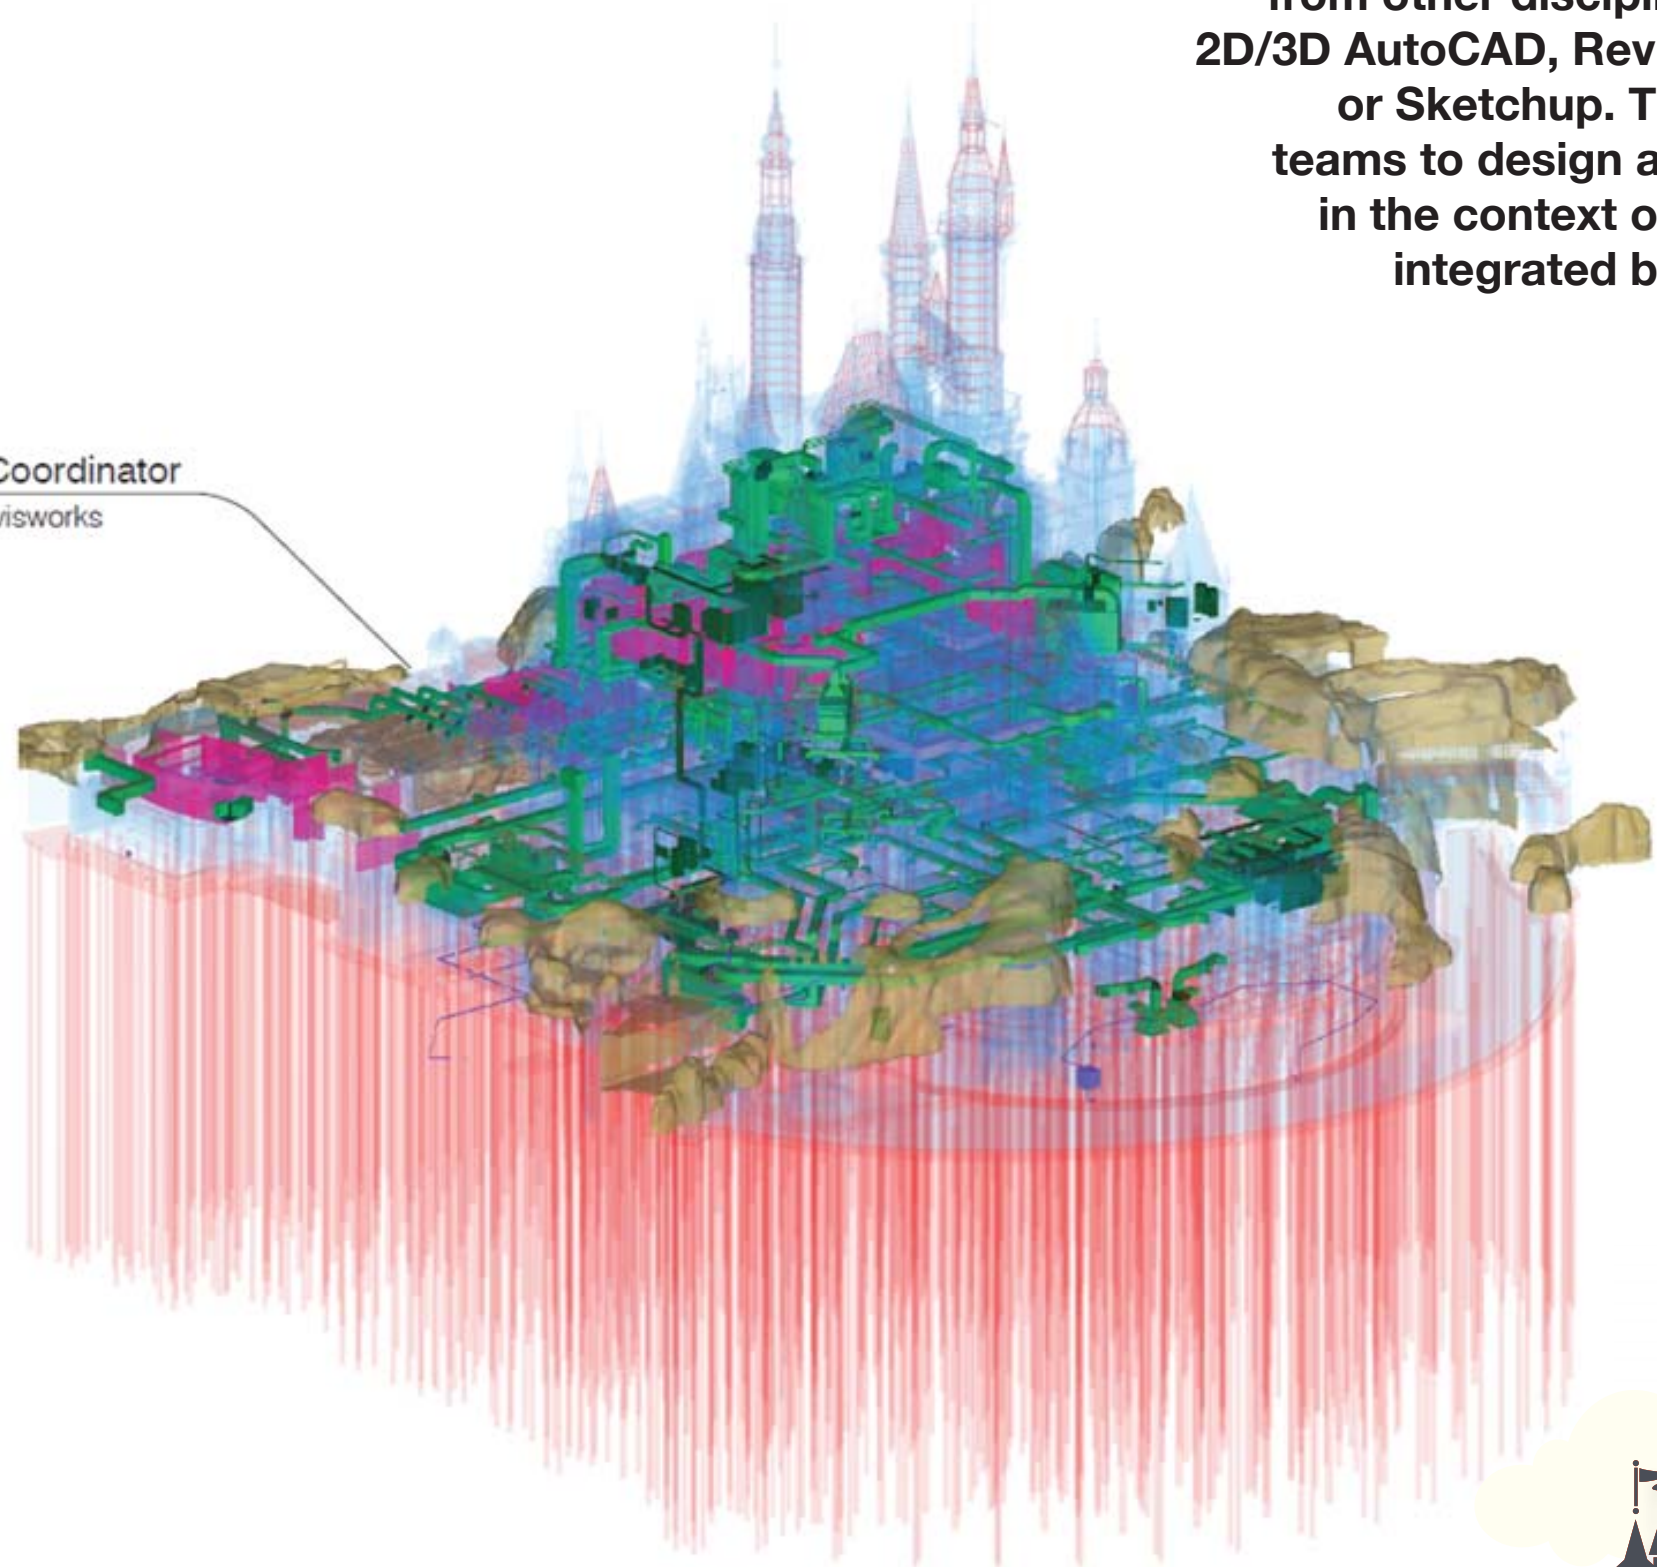

Consolidated Architecture Model

BIM Coordinator
3D Navisworks

The Architecture team was able to merge their Revit model with input from other disciplines - whether 2D/3D AutoCAD, Revit, Solidworks, or Sketchup. This allowed all teams to design and coordinate in the context of a completely integrated building model.

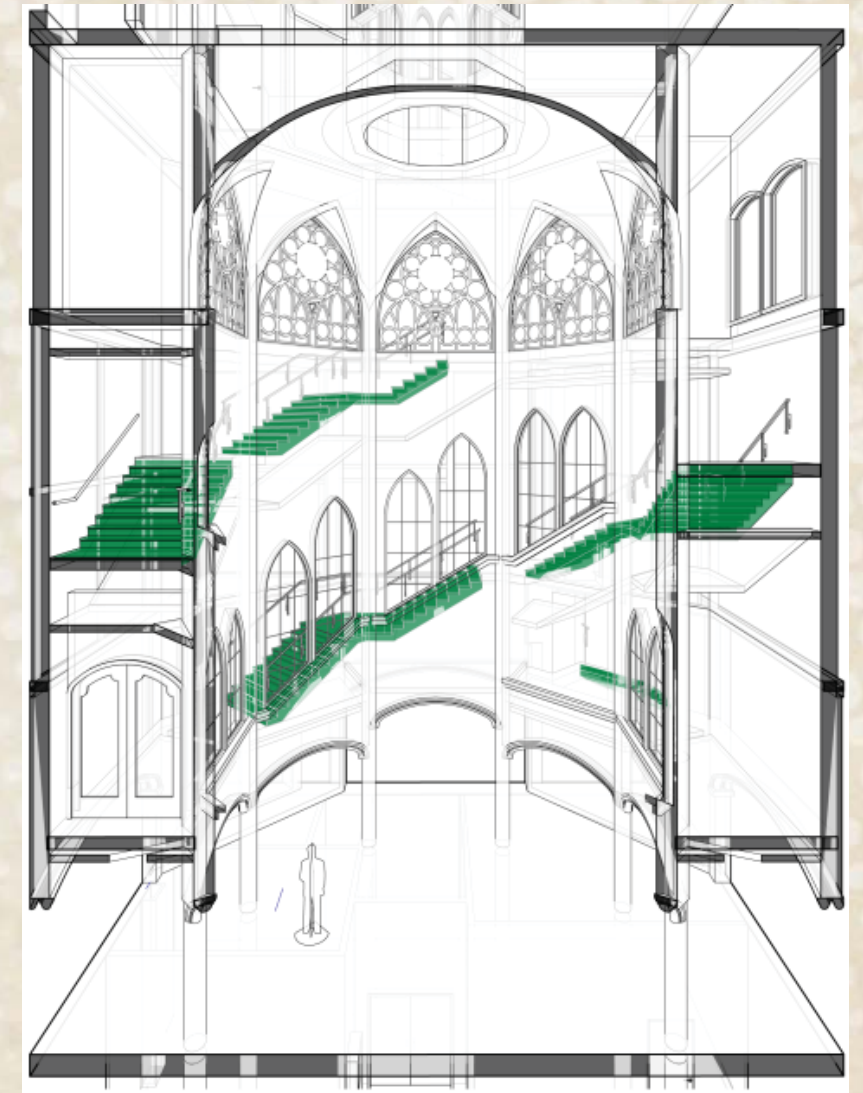

Stair constrained ceiling

Stair adjusted

Adjusted stair allows for additional ceiling height

The use of parametric BIM components in a native 3D workspace allowed for a quick update to the stair and window heights. For example, testing a design option for a new monumental staircase integrated with the exterior building envelope was completed in approximately two hours as opposed to several days.

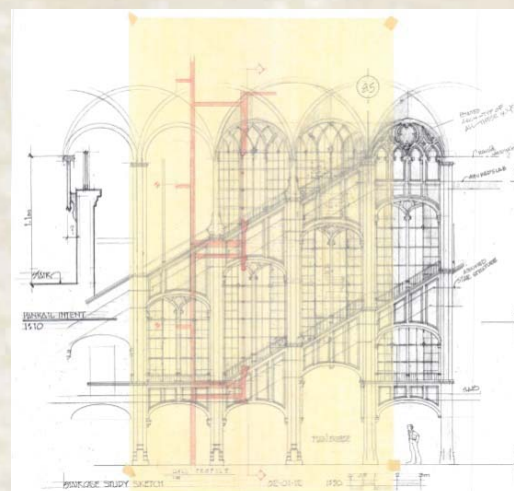

The intelligent BIM model allowed us to quickly redesign by hand, update the model, and then generate new backgrounds for additional hand sketching and design.

FINAL CONCEPT RENDERING

START

CONCEPT SKETCH

UPDATE REVIT MODEL

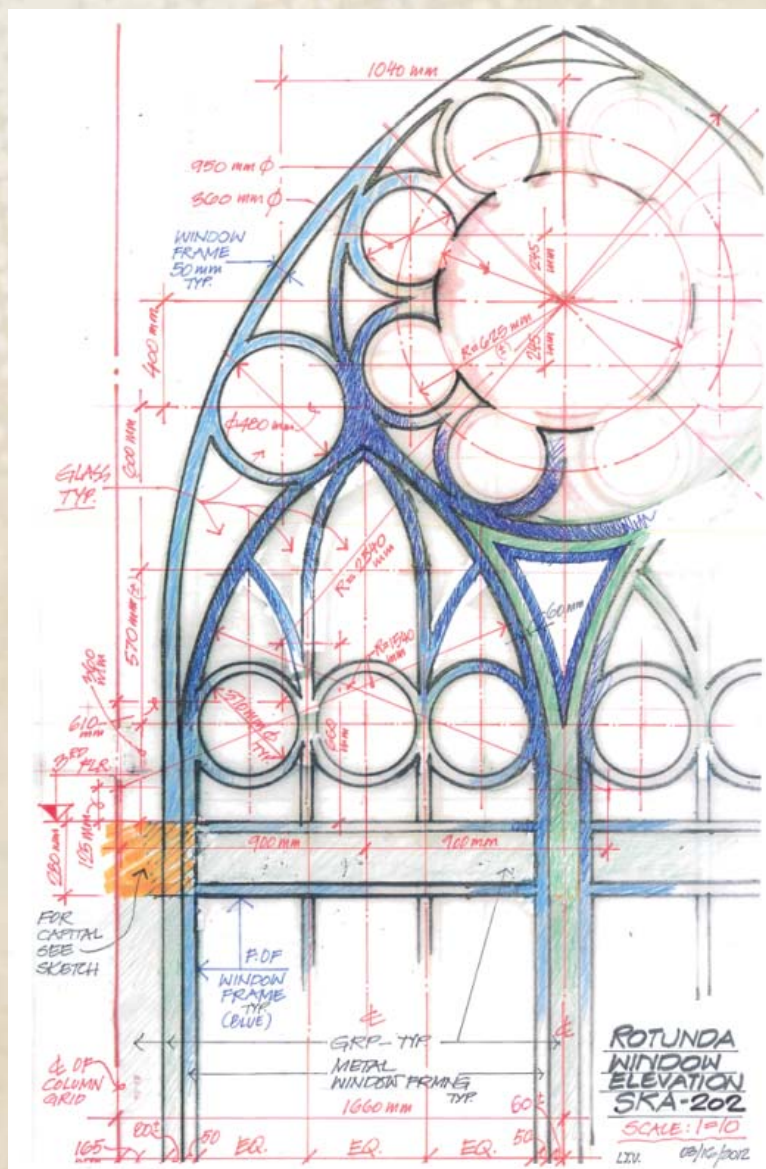

MODEL GENERATES BACKGROUNDS

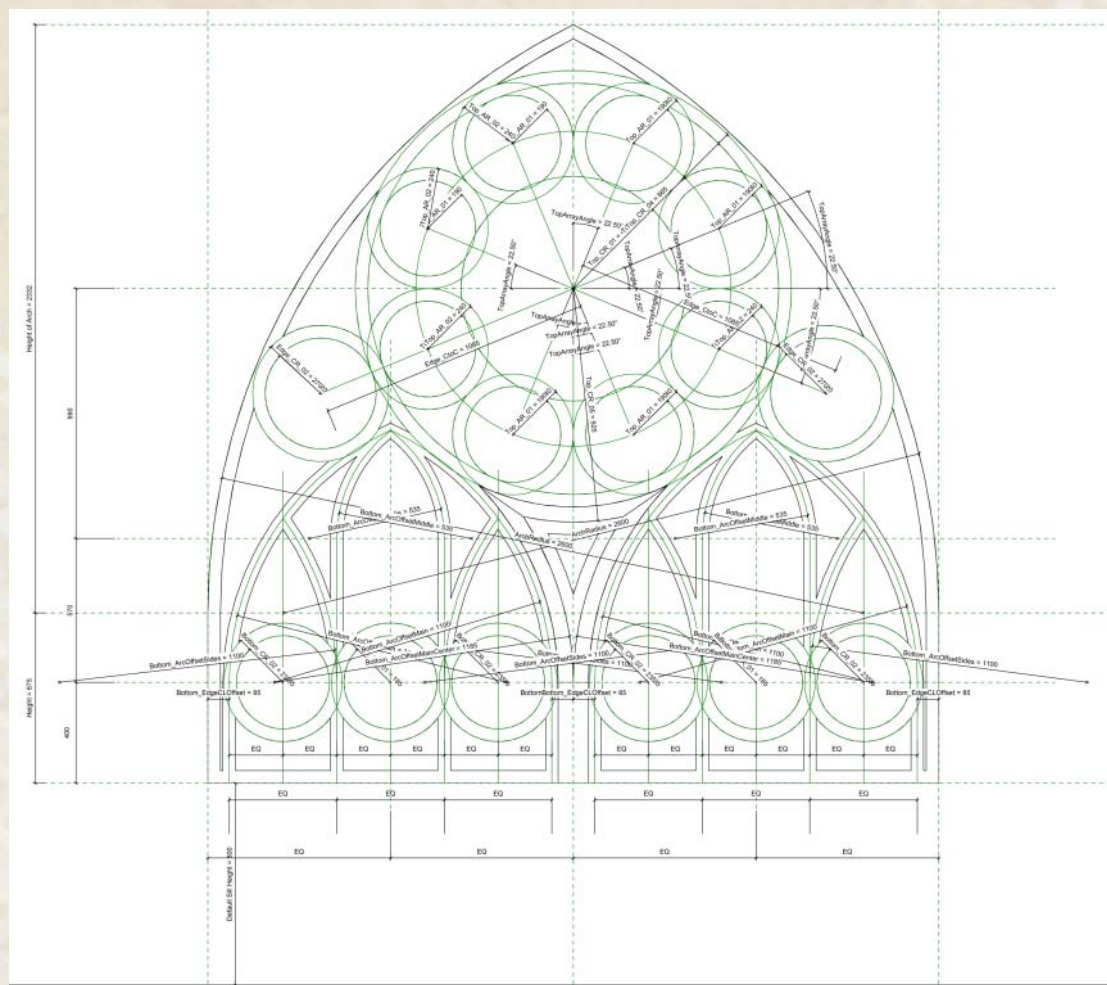

COORDINATE DESIGN

Building geometry with parametric control allows the design to be easily adjusted without re-building the component multiple times. Each adjustment now takes several minutes instead of several days, as almost none of the previous modeling effort is wasted.

Window sketch with control dimensions

Parametric Revit Window Family

The material attributes assigned to all geometry in the BIM model allows the team to quickly color the model and visualize material types. This helps to inform the work of third-party vendors, the contractor, project estimators, and architects.

The BIM model allows a complete version of the castle to be visualized during design reviews.

Traditional 2D documents are difficult to understand, especially for those without engineering, architectural, or construction backgrounds. 'The DISH' puts end users in the space providing them with an immersive environment to evaluate the spatial aspects of a design.

'The DISH' is a fully immersive 3D projected room used for virtual mockups.

Partnering with our park operations team, we were able to use the BIM model for crowd simulation studies. Since the space was realistically modeled, our colleagues were able to determine accurate instantaneous demand for all the spaces within the building, as well as determine any pinchpoints in the design.

The project team used the BIM model to solve construction challenges before going into the field.

The final model, incorporating all 142 disciplines.

By pairing the BIM model with construction sequencing software, project management is able to test and validate site logistics and practical construction activities, coordinate contractor activities, and keep the project on schedule.

- ST Steel

The BIM model is used for on-site construction coordination in our 'Big Room', allowing all stakeholders to be represented.

"The years of work we started back in California - as well as the continuing Revit contributions from our local design team in Shanghai - help inform our daily 'Big Room' work sessions with our general contractor. This is a great example of how our BIM project is bringing together an international group of team players to help solve solutions."

We now have a trained and experience team of Revit users both in Glendale and Shanghai that can continue the knowledge base."

- Construction Manager

During construction, the architectural team holds daily meetings with the General Contractor to track vendor progress on Architectural Ornamentation, and ensure the project is staying on schedule. Both the model and the original 2D concept sketches are used to quickly confirm design intent.

The model - used as a base for this hand-painted rendering - even finds its place in inspiring the design team, management, construction workers, and the general public.

"This facility is the most complex and architecturally challenging that I've designed in my career: with retail, dining, operations and theatrical spaces... and a ride system running through it. A project with so many moving parts and different disciplines that it would have been absolutely impossible to deliver on time and on budget without having one integrated, central, smart model."

- Project Architect
