Construction: The next great tech transformation

By Michael Marks

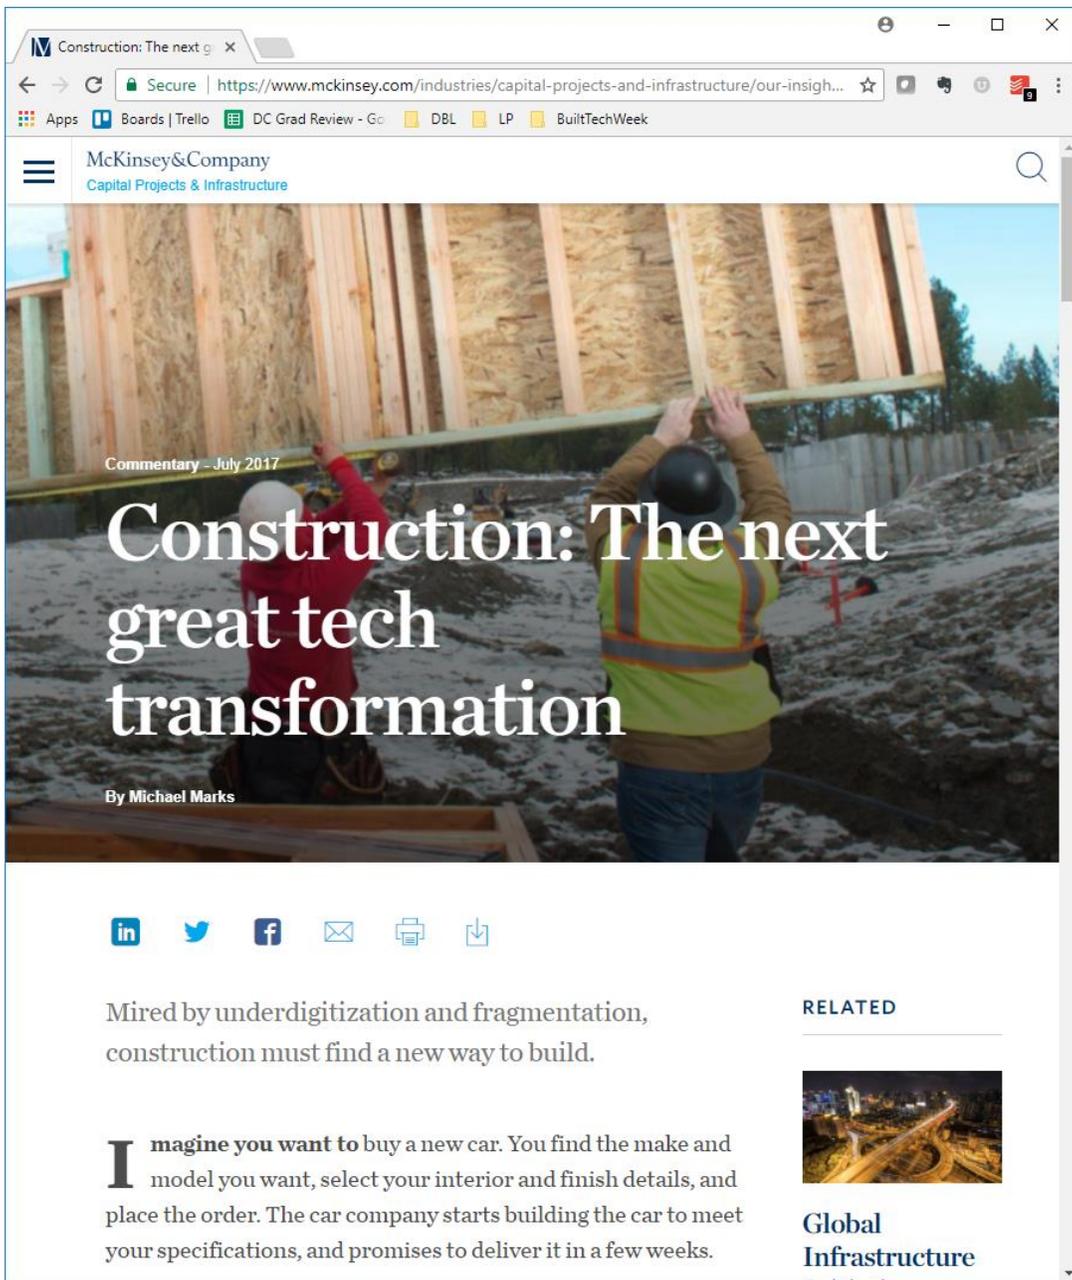

in | | | | |

Mired by underdigitization and fragmentation, construction must find a new way to build.

I magine you want to buy a new car. You find the make and model you want, select your interior and finish details, and place the order. The car company starts building the car to meet your specifications, and promises to deliver it in a few weeks.

Global Infrastructure

A screenshot of a web browser displaying a McKinsey & Company article. The browser's address bar shows the URL: https://www.mckinsey.com/industries/capital-projects-and-infrastructure/our-insigh... The page header includes the McKinsey & Company logo and the navigation menu: Apps, Boards | Trello, DC Grad Review - Go, DBL, LP, BuiltTechWeek. The main content area features a large image of construction workers in safety gear working on a wooden frame structure. Below the image, the article title 'Construction: The next great tech transformation' is displayed in large white text, with the author 'By Michael Marks' underneath. A row of social media sharing icons (LinkedIn, Twitter, Facebook, Email, Print, Download) is positioned below the title. The article's lead paragraph reads: 'Mired by underdigitization and fragmentation, construction must find a new way to build.' The first sentence of the main text is: 'Imagine you want to buy a new car. You find the make and model you want, select your interior and finish details, and place the order. The car company starts building the car to meet your specifications, and promises to deliver it in a few weeks.' To the right of the main text, there is a 'RELATED' section with a small image of a highway interchange at night and the title 'Global Infrastructure'.

Tech disruption - characteristics

- **Take on fragmented industries** by **integrating a number of traditionally distinct capacities** in a supply chain into a single enterprise and business model, often streamlining the internally integrated process, **“reducing friction”** across these steps, and monetizing multiple distinct offerings into a single service.
- Use technology – specifically **data driven technology** – as a way of streamlining cross process operations, **supporting capacity to scale non-linearly** (reducing the marginal costs of each additional customer or engagement).
- They capture data that is normalized by large scale repetition of process, and can use this data to pinpoint and **test variations in process and product to continuously improve**.
- Their integrated supply chains **connect to the customer** and end users, and they are able to use data both about and for their customers to **maintain continuous long term relationships**.
- They frequently operate as **hybrid product – services** companies: traditional one-of purchases are delivered through ongoing procurement and services.
- Many have **capital driven scaling** as business driver, with scaling prioritized over short term profitability. The scaling of these business models is quite different from the aggregative “roll-up” models prevalent in some sectors of the building industry.

CHANGE ORDER

AIA Document G701

PROJECT
 Dumbo Townhouses
 55 Pearl Street
 Brooklyn, NY 11201

PROJECT NUMBER: 1202
CHANGE ORDER #: 4
 DATE: March 4, 2014

OWNER
 55 Pearl Street LLC
 c/o Alloy Development Holdings
 20 Jay Street, Ste. 1003
 Brooklyn, NY 11201

THE CONTRACT IS CHANGED AS FOLLOWS:

As per the attached Euro Iron invoice #1140225271 dated 2/25/14, RSA CSKs #10R4, #11R5, #12R2, #13R, the approved record set of structural steel shop drawings dated 2/12/14 and correspondence from RSA between 2/21 - 2/25:

Fabrication and installation of additional (6) HSS 5x3x3/8" columns and (5) W12x19 beams at Grid 'A', and (4) MC12x35 channels at Penthouse Terrace framing at North skylights	\$ 12,800.00
Fabrication and installation of (24) web stiffeners at Mezzanine perimeter W21x93 and W14x43 beams at Ductal bearing plate locations	\$ 1,500.00
Additional detailing due to said revisions	\$ 2,500.00
Subtotal:	\$ 16,800.00
Overhead and Fee (0%):	\$ -
Subtotal:	\$ 16,800.00
Insurance (0%):	\$ -
TOTAL CHANGE ORDER	\$ 16,800.00

The original Contract Sum was	\$ 5,901,682.12
The net change by previously authorized Change Orders	\$ 21,204.00
The Contract Sum prior to this Change Order was	\$ 5,922,886.12
The Contract Sum will be increased by this Change Order in the amount of	\$ 16,800.00
The new Contract Sum including this Change Order will be	\$ 5,939,686.12

The Contract Time will be increased by 0 days
 The date of Substantial Completion as of the date of this Change Order therefore is 3/30/2015

NOT VALID UNTIL SIGNED BY THE ARCHITECT, CONSTRUCTION MANAGER AND OWNER.

TECHNOLOGY-DRIVEN ARCHITECT-ENTREPRENEURS

02 | Vol. 90 | 2020

New Scope

Similarly, technology companies are places where architects can learn the value of innovation to entrepreneurs as advisory board members. Serving on such boards of software companies like Autodesk, Oracle, Microsoft and Gehl Technologies was an education in building a technical service and digital tool company, financing shareholder agreements and acquisition negotiations.

Greg Lynn FORUM role at Curbed, a company positioned at the intersection of digital and physical shopping, was not project based, but instead that of design advisor for all physical structures including its applicable pick-up pods, Palo Alto office headquarters, and all other elements of the physical brand. Compensation was a combination of time and expense with equity ownership. This investment in the success, cost and performance of the design and construction process meant that innovation and entrepreneurship were linked. Even after the recent acquisition of the Curbed by Rakuten, the mutual investment in design innovation and business relationships persists.

As co-founder and CEO of consumer robotics company Ploggo Fast Forward, he helps to build processes and a business strategy around innovative plans in acutely apparent, encompassing market creation, supply chain, logistics, distribution, manufacturing, assembly, cost-reduction and product development. The company is majority owned by Ploggo Group, the largest wheel-chair manufacturer in Europe, and maker of the Vespa among other lightweight vehicles. Ploggo Fast Forward was founded in 2015 with Jeffrey Schragge and Michele and Roberto Colaninno, two recent architecture school graduates from MIT and Harvard, two graduates from the Rhode Island School of Design, a University of California, Los Angeles (UCLA) business school graduate, and a junior faculty member from Harvard. The first task was to define a large problem different from other mobility and robotics start-ups, a question that connects with the lively legacy of the Vespa scooter, Moto Guzzi and Aprilia motorcycles that Ploggo designs, builds and sells. The robotics company is defined by 'Autonomy for Humans', involving machines that understand performance. More and more machines are beginning to move autonomously in the presence of people, however the problem of human-machine interaction on sidewalks is more complex than self-driving cars move on roadways. Where perhaps engineers can solve the challenges of autonomous cars sharing roads with human drivers, a more architectural and urban insight is required to design intelligent machines that move with people on sidewalks and in and out of buildings. The company needed to innovate new products with wheels that use following to move without being driven, and these are being rapidly commercialised for entrepreneurial consumer markets.

© Ploggo

Architects' vision and perspicacity means they are poised to become innovators. Yet they are trained to believe their work is finished with the creation of an original idea, meaning they lack entrepreneurship. The work of an entrepreneur is not to be original or innovative. Even though entrepreneurs may look and sound like innovators and creatives, they rarely are. They are execution specialists who take on risk and responsibility in building companies in exchange for reward. More like developers than architects, they feed on innovation, but do not often create it. However, there are ways that architects can become more entrepreneurial: first, by automating parts of the existing scope of architectural services and replacing the expensive labour associated with the profession with machines that they design, engineer and own; and second, by getting out of the business of handing over plans to others for execution, and instead talking on the risk and possible reward of building and developing in addition to designing.

Builder or Entrepreneur?

Experience in understanding the distinct domains of entrepreneurship and innovation is important. Architects' vision and perspicacity means they are poised to become innovators, but they are trained to believe their work is finished with the creation of an original idea, meaning they lack entrepreneurship. The work of an entrepreneur is not to be original or innovative. Even though entrepreneurs may look and sound like innovators and creatives, they rarely are. They are execution specialists who take on risk and responsibility in building companies in exchange for reward. More like developers than architects, they feed on innovation, but do not often create it. However, there are ways that architects can become more entrepreneurial: first, by automating parts of the existing scope of architectural services and replacing the expensive labour associated with the profession with machines that they design, engineer and own; and second, by getting out of the business of handing over plans to others for execution, and instead talking on the risk and possible reward of building and developing in addition to designing.

Autonomy for Humans: designed and installed by a consumer robotics company Ploggo Fast Forward. The aim is to create the first generation of autonomous vehicles that can move on roads and sidewalks, and in and out of buildings. The vehicles are designed to be used in a variety of settings, including as a personal mobility vehicle and as a delivery vehicle. The vehicles are designed to be used in a variety of settings, including as a personal mobility vehicle and as a delivery vehicle. The vehicles are designed to be used in a variety of settings, including as a personal mobility vehicle and as a delivery vehicle.

currently a great deal of discussion about mobility as well - for instance using more electric bikes and reducing the number of cars. But there is also a great deal of research and experimentation taking place in the Netherlands with respect to densification, and how to establish new neighbourhoods that can incorporate emerging technologies to sustain growing populations.

A good example of this is the Brainport Smart District (BSD), a project in Helmond, near Eindhoven, where a large number of hi-tech technology companies are located. UNStudio has developed the urban vision for this new neighbourhood, while UNStudio plays a key role in the planned use of technology. The district will support a combination of living and working. Ninety per cent of services will be circular, including 100 per cent energy neutrality and self-supporting water systems. Food production aims to create new forms of community and building. People will be able to enjoy shared gardens, where they can produce food for themselves and the community, should they wish. Forty per cent of the required food can be produced in the district, and 60 per cent within a radius of 100 kilometres (62 miles).

UNStudio and Eindhoven Brainport Smart District, Helmond, The Netherlands, 2019

UNStudio is a multi-disciplinary architectural and urban design firm. We work on a wide range of projects, from residential and commercial buildings to large-scale urban planning and infrastructure. Our approach is based on a deep understanding of the needs and aspirations of our clients, and a commitment to creating innovative and sustainable solutions.

Johns Hopkins University, Baltimore, MD, USA, 2019

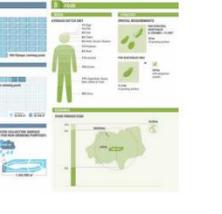

Underlying the project will be a data platform, which will make it possible to monitor the performance of the different building systems for all of the 1,500 houses. The data platform is set up as a separate company in order to be able to involve other small investors.

UNStudio is starting with an experiment involving 100 houses. The project is intended to research and develop new models in which inhabitants of the district as a whole can benefit directly from data. UNStudio wants to investigate what happens when data is used for the benefit of the community. For instance, residents in the neighbourhood could organise themselves in order to exert more influence on, for example, how mobility and energy are organised. However the residents remain the owners of their own data at all times. They decide whether or not they want to take part in an experiment. To guarantee this, a trust body is currently being formulated that can provide a guarantee for experiments, so that residents can see whether they meet requirements on privacy, property, security and ethical considerations.

Johns Hopkins University, Baltimore, MD, USA, 2019

Developing New Technologies on the Product Side In addition to urban projects, UNStudio and UNStudio are involved in the research and development of new architectural products, one of which is a new photovoltaic (PV) module which can be used as cladding for the building envelope. High-rise buildings do not have enough roof surface to accommodate the amount of solar panels that would be needed to make the buildings net zero, and whilst building-integrated photovoltaics (BIPV) have made steps in the right direction, they do not offer a complete design solution for architects. This is why UNStudio's Knowledge team originally worked on the research, design and development of a new technology for aesthetic solar-panel cladding modules for full facade integration. This research and development was carried out as part of a European research project and in collaboration with the Concrete PV consortium. The product is called Solar Visuals and is now approved and can be implemented. However, as it needs to go to market in innovative ways, UNStudio joined forces with the

printing company TS Visuele and 'ECN part of' TNO (the Energy Research Centre within The Netherlands Organisation for applied scientific research). Currently companies are being selected to partner with and to invest in this product, including large glass companies, while the modules undergo further development.

Another product that UNStudio is developing is RESET (2017), which was first developed by UNStudio and SCAPE at the Salone del Mobile in Milan. There, RESET was organised as a series of pods that featured scientifically proven stress-reduction methods in a playful and interactive way. It was designed to empower people to deal with stress more effectively. Everything visitors did in the pods was measured by sensors. These sensors traced the visitor's response to the stress-reduction experiences and provided real-time feedback. UNStudio is now talking to several tech companies, investigating possibilities to install similar RESET pods in high-stress spaces, such as airports or work settings.

Spinoff Incubators: UNStudio / UNSense

The architect needs to be a cultural entrepreneur: interested in business, but also with a genuine fascination for culture.

Technology is increasing – not decreasing – the demand for the social aspects of architecture & design.

Design – Build Integrators: Front

Front ultimately [pulled] out of the contracting business and instead leveraged all of the knowledge that had been acquired – in logistics, scheduling, costs, procurement, means and methods, and detailed systems design, analysis, automation and quality control – emerging as an augmented and comprehensive building envelope design, engineering and consulting practice.

Front's evolution as a firm and the skill set gained through this evolution are what enable it to now take on [humanitarian] projects. As a global consulting practice, this capacity starts with a holistic understanding of the kinds of problems of envelopes, identification of needs, the ability to build relationships and to create the circumstances under which one can actually act, and ultimately to carry a project to realization.

THE DISRUPTORS

A SYMPOSIUM ON BUILT ENVIRONMENT ENTREPRENEURSHIP

MAY 8-11, 2020
NEW YORK CITY

The building industries are entering a period of radical transformation. Startups are proliferating. Traditional architecture and engineering firms are creating incubators and spin-offs. Tech companies are becoming interested in the built environment as the next platform for technological and economic disruption. New careers are emerging for architects beyond building design.

Join leading architects, startups, investors and visionaries for a conversation and celebration of disruptive technologies and the future of the built environment.

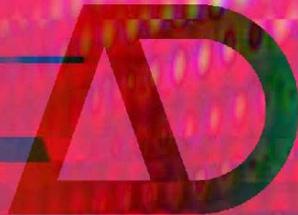

Panels include:

FIRMLEADERS	FUTURISTS
DESIGNERS	STARTUPS
NEW BUILDERS	INVESTORS
DEVELOPERS	INCUBATORS
